## EXECUTIVE SUMMARY

A Traffic Signal Warrant Study was conducted for the intersection of U.S. 17 and Crystal Beach Road located in Eagle Lake (Polk County), Florida to determine if a traffic signal should be installed at the intersection. Based on the signal warrant analysis it is recommended that a traffic signal not be installed at the intersection of U.S. 17 and Crystal Beach Road.

## 1

## INTRODUCTION

Traffic Engineering Data Solutions, Inc. (TEDS) was retained on behalf of the Florida Department of Transportation (FDOT) to conduct a Traffic Signal Warrant Study at the intersection of U.S. 17 and Crystal Beach Road. The study intersection is located in Eagle Lake (Polk County), Florida as shown in Figure 1.
The analysis methods used in completing this study are consistent with the Federal Highway Administration (FHWA) Manual on Uniform Traffic Control Devices (MUTCD), FDOT Manual on Uniform Traffic Studies (MUTS), and FDOT Traffic Engineering Manual (TEM). This report documents existing conditions, vehicle counts, crash analysis, qualitative assessment and signal warrant analysis.

## 2

## EXISTING CONDITIONS

U.S. 17 is a north/south arterial roadway that extends from the Hardee/Polk county line north through the study intersection to the Polk/Osceola county line. As shown in Figure 2, U.S. 17 is a divided roadway with no curb and gutters, two lanes in each direction south of the intersection and three lanes in each direction north of the intersection. Crystal Beach Road is a residential road extending 3.11 miles from U.S 17, ending at S.R. 540 in Polk County. At the study intersection, Crystal Beach Road is a two-lane undivided roadway with no curb and gutter and no shoulder. A railroad extends along the west side and parallel to U.S. 17 with a crossing located less than 100 feet west of the study intersection.

Figure 2
General Location Aerial U.S. 17 at Crystal Beach Road

Table 1 on the following page summarizes the existing conditions for the study intersection. An existing condition diagram and photographs of the study intersection follow Table 1. A straightline diagram is also included in the Appendix.

Table 1 Summary of Existing Conditions U.S. 17 at Crystal Beach Road

| Feature | Description |
| :---: | :---: |
| Main Street | - U.S. 17 |
| Area Location | - Eagle Lake (Polk County), Florida |
| Adjacent Land Uses | - Southwest: Railroad <br> - Southeast: Citrus Grove <br> - Northwest: Railroad <br> - Northeast: Citrus Grove |
| Traffic Control | - One-way STOP-sign controlled with U.S. 17 having the right-of-way |
| Adjacent Signalized Intersections | - South: Bomber Road - 1.58 miles <br> - North: Eagle Avenue - 0.46 miles <br> - West: None |
| U.S. 17 | - Cross Section: South of the intersection: Four-lane roadway with a 4foot paved outside shoulder and no curb and gutter <br> North of the intersection: Six-lane one-way pair with a 4 -foot paved outside shoulder and no curb and gutter (curb and gutter provided along the southbound outside right-turn "drop" lane) <br> - Posted Speed Limit: 45 mph <br> - AADT: 25,500 vehicles per day (2017) <br> - Roadway Alignment: Straight with a northbound horizontal curve departing the intersection <br> - Northbound Approach Lanes: One (1) left-turn lane and two (2) through lanes. <br> - Southbound Approach Lanes: One (1) left-turn lane, two (2) through lanes, and one (1) right-turn "drop" lane <br> - Pedestrian Crossings: None <br> - Sidewalks: None <br> - Utilities: Overhead power poles on the both sides of the roadway <br> - Street Lighting: Lighting on both sides of the roadway |
| Crystal Beach Road | - Cross Section: Two-Lane undivided roadway with no paved shoulders and no curbs and gutter <br> - Eastbound Approach Lanes: One (1) left-turn lane and one (1) undesignated right-turn lane. <br> - Pedestrian Crossings: None <br> - Sidewalks: None <br> - Utilities: Overhead power poles on the south side of the roadway <br> - Street Lighting: None <br> - Railroad Crossing: Crossing \# 623049F located approximately 100 feet west of U.S. 17. Equipped with gates and warning signals for both directions. |

## Traffic Volumes

- Twenty-four-hour approach counts were conducted on all three (3) approaches at the study intersection as summarized below in Table 2. According to these counts, the intersection had a daily traffic volume of 23,739 vehicles that entered the intersection consisting of 10,105 northbound vehicles, 10,890 southbound vehicles, and 2,744 eastbound vehicles.

| $\mathbf{2 2 - 2 3}$ | 135 | 157 | $\mathbf{2 9 2}$ | 19 | $\mathbf{1 9}$ | $\mathbf{3 1 1}$ |
| $\mathbf{2 3 - 2 4}$ | 86 | 117 | $\mathbf{2 0 3}$ | 15 | $\mathbf{1 5}$ | $\mathbf{2 1 8}$ |
|  | $\mathbf{1 0 , 1 0 5}$ | $\mathbf{1 0 , 8 9 0}$ | $\mathbf{2 0 , 9 9 5}$ | $\mathbf{2 , 7 4 4}$ | $\mathbf{2 , 7 4 4}$ | $\mathbf{2 3 , 7 3 9}$ |

Based on a review of the twenty-four-hour count data, eight (8) hours of manual turning movement counts were collected from 6:00 to 9:00 a.m., 10:00 to 11:00 a.m., and 2:00 to 6:00 p.m. on a weekday. The vehicular movements are summarized in Table 3. Vehicular, pedestrian, and bicycle movement summaries are provided in the Appendix.

- The intersection morning peak hour occurred from 7:00 a.m. to 8:00 a.m., while the afternoon peak hour occurred from $4: 45$ p.m. to $5: 45$ p.m. For the morning and afternoon peak hours, 2,111 and 2,157 vehicles were counted entering the intersection, respectively.

Table 3
Summary of 8-Hour Vehicular Turning Movements
U.S. 17 at Crystal Beach Road

- During the eight (8) hours of manually collected turning movement counts, heavy trucks, which include single unit trucks such as delivery trucks (Class 5 to 7) and tractor-trailer trucks (Class 8 to 15), accounted for approximately $3.6 \%$ of the traffic passing through the intersection.
- Two (2) pedestrians and three (3) bicyclists were observed traversing the intersection during the count period. One (1) pedestrian traveled northbound while the other pedestrian travelled southbound. All pedestrian/bicycle activity was along U.S. 17.

## Collision Data

Crash data for the 36-month period between January 1, 2015 and December 31, 2017 was obtained from FDOT's CARS database and University of Florida's Signal Four Analytics. A total of 16 crashes were reported at the intersection as summarized in Table 4 below:

Table 4
Crash Type Summary
U.S. 17 at Crystal Beach Road

| CRASH TYPE | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 6}$ | $\mathbf{2 0 1 7}$ | TOTAL | AVERAGE <br> PER YEAR |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Angle | 3 | 5 | 3 | 11 | 3.7 |
| Rear-End | 0 | 0 | 2 | 2 | 0.7 |
| Right-Turn | 0 | 1 | 0 | 1 | 0.3 |
| Side-Swipe | 0 | 1 | 1 | 2 | 0.7 |
| Total | $\mathbf{3}$ | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{1 6}$ | $\mathbf{5 . 3}$ |

Source: Florida Department of Transportation and University of Florida's Signal Four Analytics

- The crashes resulted in zero (0) fatalities, six (6) injuries, and $\$ 78,350$ in estimated property damage.
- 14 crashes occurred during the day and the remaining two (2) crashes occurred at night.
- 15 crashes occurred on dry pavement conditions and one (1) crash occurred on wet pavement conditions.
- The angle crashes are summarized as follows:
- Ten (10) involved eastbound left-turning drivers who failed to yield to southbound through vehicles. The crash reports for three (3) of these crashes indicated there was a vehicle in the southbound right-turn lane at the time the eastbound leftturning drivers were attempting to complete the turn.
- One (1) involved an eastbound left-turning driver who failed to yield to a northbound left-turning vehicle. The crash report noted the at-fault driver stated her vision was obscured by the sun in her eyes.
- One (1) side-swipe crash occurred when an eastbound left-turning driver struck another eastbound left-turning driver who was staged in the median opening.

Additionally, crash data for the period from January 1, 2018 to December 31, 2018 was obtained from the University of Florida's Signal Four Analytics. Over this period, three (3) angle crashes were reported at the study intersection and all were the result of an eastbound left-turning driver failing to yield to a southbound through vehicle. Two (2) of the three crashes resulted in possible injuries. Two (2) of these crashes indicated there was a vehicle in the southbound right-turn lane at the time the eastbound left-turning drivers were attempting to complete the turn.

Detailed collision summaries and collision diagrams are also provided in the Appendix.

## Intersection Delay

An intersection delay study was performed for both the eastbound left-turn and right-turn movements. Procedures from the MUTS were applied to determine the summarized results presented in Table 5.

Table 5
Summary of Delay Studies
U.S. 17 at Crystal Beach Road

| Movement | Time | Maximum Queue (Veh) | Average Delay per Vehicle (Sec) | Maximum <br> Delay per Vehicle (Sec) | Volume (Veh/Hr) | Total <br> Delay (Veh-Sec) | Total <br> Delay (Veh-Hr) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Eastbound Left-turn Movement | 7:00 AM - 8:00 AM | 9 | 30 | 137 | 162 | 4,784 | 1.37 |
|  | 4:15 PM - 5:15 PM | 7 | 27 | 136 | 98 | 2,685 | 0.76 |
| Eastbound Rightturn Movement | 7:00 AM - 8:00 AM | 5 | 16 | 50 | 65 | 1,046 | 0.32 |
|  | 4:15 PM - 5:15 PM | 3 | 17 | 50 | 35 | 600 | 0.17 |

Generally, an average delay in excess of 60 seconds is considered excessive at an unsignalized intersection and what could typically be expected if the intersection were signalized. As shown in Table 5, the average delay for the eastbound left-turn movement ranged from 27.4 seconds per vehicle to 29.5 seconds per vehicle. The maximum delay that was recorded for the eastbound left-turn movement was 137 seconds and 136 seconds during the morning and afternoon peak periods, respectively. A total of 55 eastbound left-turn vehicles experienced delay in excess of 60 seconds over the two-hour period. The average delay for the eastbound right-turn movement ranged from 16.1 seconds per vehicle to 17.1 seconds per vehicle. The maximum delay that was recorded for the eastbound right-turn movement was 50 seconds during both peak periods.
The intersection of Crystal Beach Road and $3^{\text {rd }}$ Street is located approximately 140 feet west of the study intersection. Queues were observed extending from U.S. 17 and through the $3^{\text {rd }}$ Street intersection. Because of this queue, it was unknown if drivers who were queued past $3^{\text {rd }}$ Street were going to turn onto $3^{\text {rd }}$ Street or continue to U.S. 17. For the purposes of this delay study calculation, drivers who ultimately turned onto $3^{\text {rd }}$ Street were released from the queue when they turned.

## 3 <br> QUALITATIVE ASSESSMENT

The intersection of U.S. 17 at Crystal Beach Road was observed by a registered professional engineer during the peak hours to assess existing operating conditions and to determine if installing a traffic signal would be potentially beneficial.

## Operations

Operations include the efficiency of operation and interaction of motor vehicles, pedestrians, and bicyclists at the intersection. The following observations were made with respect to the roadway and roadside characteristics of the study location.

- The posted speed limit at the intersection is 45 mph , however increases to 55 mph just south of the intersection. Northbound and southbound vehicles on U.S. 17 appeared to be travelling at or above 55 mph . Most northbound drivers did not appear to have slowed as they travelled through the intersection.
- U.S. 17 is a four-lane divided roadway south of the study intersection and transitions into a one-way pair facility to the north with three through lanes in each direction. While travelling southbound the outermost through lane becomes a right-turn "drop" lane at Crystal Beach Road. While traveling northbound, the third through lane is developed out of the median opening. Many drivers in the middle northbound through lane were observed changing into the inside through lane while driving past the median opening.
- No pedestrians or bicyclists were observed at the intersection during the field observations.
- There is adequate sight distance for all approaches, with the exception of when there are right-turning vehicles in the southbound right-turn lane. Several crash reports noted that eastbound left-turning drivers were unable to see approaching southbound through vehicles due to a southbound right-turning vehicle within the turn lane.
- Florida Midland Railroad Company tracks extend along the west side of U.S. 17 with a crossing (Crossing \# 623049F) on Crystal Beach Road, approximately 100 feet west of the intersection. There is sufficient space for two (2) eastbound vehicles to queue at the stop bar while waiting to enter U.S. 17. The maximum observed eastbound queue was 10 vehicles with a few instances of eastbound vehicles stopping on the tracks. The USDOT crossing inventory form indicates there are no daily trains at this crossing, however there are two switching trains daily. A rail yard was noted south of the study intersection. There was one slow-moving train crossing during the field observation. The train travelled northbound and then came back southbound within 10 minutes. Vehicles arrived at the intersection during the train crossings. All motorists appropriately observed the train. No conflicts were observed with vehicles waiting to cross the tracks and the delay to motorists was short.
- $3^{\text {rd }}$ Street is located approximately 150 feet west of the study intersection and intersects with Crystal Beach Road. Southbound $3^{\text {rd }}$ Street is under STOP control with eastbound and westbound Crystal Beach Road having the right-of-way. No conflicts were observed with southbound drivers on $3^{\text {rd }}$ Street accessing Crystal Beach Road.
- Eagle Lake Elementary School is located on Crystal Beach Road, approximately 750 feet west of U.S. 17. School hours are 8:00 a.m. to 3:00 p.m. A reduced speed school zone begins immediately west of U.S. 17 and extends through $3^{\text {rd }}$ Street. A school crossing
guard is posted at the intersection of Crystal Beach Road and $3^{\text {rd }}$ Street, crossing students on the east side of this intersection (just west of the railroad crossing). The crossing guard stated that he is there from $7: 10$ to 8:10 a.m. and 2:55 to $3: 25 \mathrm{p} . \mathrm{m}$. on school days. Westbound drivers who queued while waiting for the crossing were observed avoiding stopping on the railroad tracks. There was one occasion during the afternoon peak period when a queue of two (2) vehicles had developed in the southbound right-turn lane due to westbound traffic being stopped for the school crossing. No conflicts were observed with the crossing of students at the school crossing and the crossing guard did not indicate any concerns.
- The northbound left-turn volumes were generally low, with an average of 38 vph and a maximum of 68 vph from 7:00 to 8:00 a.m. A maximum queue of four (4) northbound leftturning vehicles was observed. The median opening is wide enough for drivers to stack next to each other (rather than behind) while waiting for a gap in southbound traffic (see photo below). One instance was observed when the leading driver was not taking advantage of available gaps in southbound traffic and the following driver attempted to travel along the right side of that vehicle in order to complete a turn. The leading vehicle started to move and nearly struck the following vehicle.

- Southbound right-turn volumes were moderate, averaging 110 vph throughout the count period. A maximum of 164 vph occurred from 5:00 to 6:00 p.m. No conflicts were observed with southbound right-turning vehicles.
- The peak movement from Crystal Beach Road is the eastbound left-turn movement, averaging nearly $75 \%$ of the total approach volume. Volumes ranged from 58 to 143 vph throughout the day. Eastbound right-turn volumes were low, averaging 34 vph throughout the day. Eastbound right-turn movements were generally completed without conflict; however, challenges were noted when an eastbound left-turning driver would pull past the stop bar and block the sight line for the right-turning driver. Eastbound left-turning drivers were observed using two-stage maneuvers, crossing the southbound lanes of U.S. 17 and staging in the median opening to wait for a gap in northbound traffic. Numerous conflicts were noted with the eastbound left-turn movement:
- Up to three (3) left-turning vehicles were staged within the opening at one time, including eastbound and northbound left-turning vehicles. When multiple vehicles are staged, each one blocks the view of the other, resulting in drivers not knowing who will go first and who should yield. Although all related vehicles were able to successfully maneuver through the median, there were sight distance issues created by the staging vehicles.
- Due to the third northbound through lane developing from the median opening, many drivers were observed immediately accessing the inside northbound through lane without stopping/yielding for approaching northbound vehicles. This resulted in conflicts with the approaching northbound through drivers who were attempting to change lanes from the middle to the inside lane (using the median opening to access the lane).
- Those leading drivers who stopped in the median opening occasionally caused following drivers to take evasive action to avoid a rear-end collision with the leading vehicle.
- Some eastbound left-turning drivers did not yield to northbound left-turning drivers, causing the northbound driver to abruptly brake.
- A maximum queue of 10 and six (6) eastbound left-turning vehicles was observed during the morning and afternoon peak periods, respectively. While the average delay for the eastbound approach was low, there were maximum delays of over 2 minutes. Delays were observed to be higher during the morning peak hour.

## Safety

In addition to the collision data evaluation, the following observations were made with respect to the safety of the study location:

- No significant signs of skid marks, plastic, or other indication of a crash were observed at this intersection.
- During the time period of January 1, 2015 through December 31, 2018, a total of 15 crashes have been reported that would be potentially correctable with the installation of a traffic signal.
- 13 angle crashes that involved eastbound left-turning drivers who failed to yield to southbound through vehicles. The crash reports for five (5) of these crashes indicated there was a vehicle in the southbound right-turn lane at the time the eastbound left-turning drivers were attempting to complete the turn.
- One (1) angle crash that involved an eastbound left-turning driver who failed to yield to a northbound left-turning vehicle. The crash report noted the at-fault driver stated her vision was obscured by the sun in her eyes.
- One (1) side-swipe crash occurred when an eastbound left-turning driver struck another eastbound left-turning driver who was staged in the median opening.

## Maintenance

During the various field reviews, the condition of the study location's pavement, pavement markings, and signing were observed. The following are observations related to maintenance of the intersection:

- The signs, pavement and pavement markings at the intersection were observed to be in good condition, with the exception of the following:
- The yellow skip pavement markings that divide the southbound inside lane from the median opening are faded.

## TRAFFIC SIGNAL WARRANT ANALYSIS AND RECOMMENDATIONS

The traffic volumes, geometric conditions, and crash data at the intersection were analyzed, summarized, and then compared with the warrants for the installation of a traffic signal contained within the MUTCD and MUTS.

Upon conducting the Signal Warrant Analysis, the northbound and southbound approaches on U.S. 17 were used as the major street and the eastbound left-turn movement on Crystal Beach Road was used as the minor street. For the purposes of the warrant analysis, the major street was treated as a two-lane approach and the minor-street was treated as a one-lane approach (left-turn lane only). Finally, based on the critical speed of 45 mph on U.S. 17, the $70 \%$ volume criterion was applied to the analysis. When considering crash history for the signal warrant analysis, the worst-case time period was used, which was during the 12-month period from June 1,2016 to May 31, 2017. During this time period, there were nine (9) crashes reported at the study intersection susceptible to correction by the installation of a traffic signal. Table 6 below summarizes the results of the warrant analysis.

Table 6
Signal Warrant Analysis Summary
U.S. 17 at Crystal Beach Road

| Warrant | Applicable | Satisfied | Comments |  |
| :---: | :--- | :--- | :--- | :--- |
| 1A | Minimum Vehicular <br> Volume | Yes | No | This warrant is not met as the minor street traffic volumesmet <br> the threshold for six (6) hours (must be met for eight (8) hours <br> of an average day). |
| 1B | Interruption of <br> Continuous Traffic | No | N/A | This warrant is not applicable. |
| $\mathbf{2}$ | Four Hour Vehicular <br> Volume | Yes | Yes | This warrant is satisfied as the traffic volumes met the 70\% <br> threshold of this warrant for four (4) hours (must be met for <br> any four (4) hours of an average day). |
| 3A | Peak Hour Delay | No | N/A | This warrant is not applicable as there is no unusual traffic <br> generator at the intersection. |
| 3B | Peak Hour Volume | No | N/A | This warrant is not applicable. |
| $\mathbf{4}$ | Pedestrian Volume | Yes | No | The pedestrian volumes do not satisfy this warrant. |
| $\mathbf{5}$ | School Crossing | No | N/A | This warrant is not applicable as no school crossing exists at <br> the intersection. |
| $\mathbf{6}$ | Coordinated Signal <br> System | No | N/A | This warrant is not applicable as the intersection is not within a <br> coordinated network. |
| $\mathbf{7}$ | Crash Experience | Yes | This warrant is not satisfied as no remedial measures have <br> been implemented reduce the crashes and Warrants 1A, 1B or <br> 4 are not met. There were nine (9) crashes potentially <br> cotrectable by a traffic signal that occurred within the 12-month <br> study period. (a total of five (5) crashes within a 12-month <br> period are required to satisfy this warrant). |  |
| $\mathbf{8}$ | Roadway Network | No | N/A | This warrant is not applicable as the minor street does not <br> meet the criteria. |
| $\mathbf{9}$ | Railroad Crossing | No | N/A | This warrant is not applicable, as other warrants are met for <br> signalization and other alternatives were not considered to <br> alleviate concerns with the crossing. |

Based on the signal warrant analysis, Warrant \#2 (Four-Hour Vehicular Volume) is met for the consideration of the installation of a traffic signal at the intersection of U.S. 17 and Crystal Beach Road. Based on the field observations, data and crash history it is recommended a traffic signal not be installed at the intersection of U.S. 17 and Crystal Beach Road until other remedial measures have been considered.

## SIGNAL WARRANT ANALYSIS WORKSHEETS

## TRAFFIC SIGNAL WARRANT SUMMARY

Record 8 highest hours and the corresponding volumes in boxes provided. Condition is $100 \%$ satisfied if the minimum volumes are met for eight hours. Condition is $(80 \%) /(56 \%)^{*}$ satisfied if parenthetical volumes are met for eight hours.

| Condition B - Interruption of Continuous Traffic | Applicable: | $\square$ Yes | No |
| :---: | :---: | :---: | :---: |
| Condition B is intended for application where the traffic volume is so heavy that traffic on the minor street suffers excessive delay or | Excessive Delay/Conflict: | $\square$ Yes | ■ No |
|  | nflict. 100\% Satisfied: | ■ Yes | $\square$ No |
|  | 80\% / 56\% Satisfied: | ■ Yes |  |

## TRAFFIC SIGNAL WARRANT SUMMARY

| City: | Eagle Lake |
| ---: | :--- |
| County: |  |
| Major Street: | US 17 |
| Minor Street: | Crystal Beach Road |

Lanes: $\quad \mathbf{2}$
Lanes: Critical Approach Speed: 45

Record hours where criteria are fulfilled and the corresponding volume or gap

| Applicable: | $\square$ Yes | $\square$ No |
| :--- | :--- | :--- |
| Satisfied: | $\square$ Yes | $\square$ No | frequency in the boxes provided. The warrant is satisfied if condition 1 or 2 is fulfilled and condition 3 is fulfilled.

| Criteria | Hour | Pedestrian Volume | Pedestrian Gaps | Fulfilled? |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Yes | No |
| 1. Pedestrian volume crossing the major street is $100 \mathrm{ped} / \mathrm{hr}$ or more for each of any four hours and there are less than 60 gaps per hour in the major street traffic stream of adequate length. | 1300 | 0 | 0 |  | $\square$ |
|  | 1400 | 0 | 0 |  |  |
|  | 1500 | 1 | 0 |  |  |
|  | 1600 | 1 | 0 |  |  |
| 2. Pedestrian volume crossing the major street is $190 \mathrm{ped} / \mathrm{hr}$ or more for any one hour and there are less than 60 gaps per hour in the major str traffic stream of adequate length. | 1500 | 1 | 0 |  | $\square$ |
| 3. The nearest traffic signal along the major street is located more than $90 \mathrm{~m}(300 \mathrm{ft})$ aw ay, or the nearest signa is within $90 \mathrm{~m}(300 \mathrm{ft})$ but the proposed traffic signal will not restrict the progressive movement of traffic. |  |  |  | $\square$ |  |

## WARRANT 5 - SCHOOL CROSSING

Record hours where criteria are fulfilled and the corresponding volume or gap

| Applicable: | $\square$ Yes |
| :---: | :--- |
| Satisfied: | $\square$ Yes |
| Yes |  | frequency in the boxes provided. The warrant is satisfied if all three of the criteria are fulfilled.

| Criteria |  |  |  | Fulfilled? |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Yes | No |
| 1. There are a minimum of 20 students crossing the major street during the highest crossing hour. | Students: <br> 0 | Hour: | 0 |  | $\square$ |
| 2. There are few er adequate gaps in the major street traffic stream during the period w hen the children are using the crossing than the number of minutes in the same perid |  | Minutes: <br> 0 | Gaps: <br> 0 |  | $\square$ |
| 3. The nearest traffic signal along the major street is located more than $90 \mathrm{~m}(300 \mathrm{ft})$ aw ay, or the nearest signal is within 90 m ( 300 ft ) but the proposed traffic signal will not restrict the progressive movement of traffic. |  |  |  | $\square$ |  |

WARRANT 6-COORDINATED SIGNAL SYSTEM
Indicate if the criteria are fulfilled in the boxes provided. The warrant is satisfied if either criterion is fulfilled. This warrant should not be applied when the resulting signal spacing would be less than 300 m (1,000 ft).

|  | Criteria | Fulfilled? |
| :--- | :---: | :---: |
|  | Yes | No |
| 1. On a one-w ay street or a street that has traffic predominately in one direction, the adjacent signals are <br> so far apart that they do not provide the necessary degree of vehicle platooning. |  | $\square$ |
| 2. On a tw o-w ay street, adjacent signals do not provide the necessary degree of platooning, and <br> the proposed and adjacent signals w ill collectively provide a progressive operation. | $\square$ |  |
