Due to the SMF being a significant distance away from the proposed right-of-way, a Perpetual Easement of 6.72-acre is being proposed through a single parcel to allow storm drain conveyance and access to the SMF for maintenance.

The estimated ground elevation at SMF 1202B is 102.0 feet, with a proposed LEOP of 114.5 feet and a SHGWT elevation of 97.4 feet. The required treatment volume is 0.41 acre-feet, while 1.51 acre-feet is provided. The required attenuation volume is 2.61 acre-feet, while 3.24 acre-feet is provided. To meet the minimum required nutrient removal rates, the treatment volume provided exceeds the presumptive requirement. Nutrient removal rates provided by SMF 1202B are 84% of Total Nitrogen (TN) and 84% of Total Phosphorus (TP).

The predominant soils at this location are Orsino Sand [11], Basinger Sand [12], and Satellite Sand [14], which are classified as Hydrologic Soil Group A and A/D. The land use in the SMF footprint is [2200] Tree Crops. Recorded historical resources at this location are rated Medium. The hazardous material risk rating is Medium. This site has a High potential to impact protected, threatened, or endangered species, with a species mitigation cost of $112,000. Estimated wetland impacts are 0.02 acre-feet, with a wetland mitigation cost of $2,000. No conservation land impacts are anticipated with this alternative.

There are no Section 4(f) areas located near the site. A Florida Gas Transmission (FGT) gas pipeline is present near the site, with potential impacts. Two parcels are affected, requiring a partial take (P) of each. There are no floodplain impacts; therefore, no compensation cost is required. Total cost is estimated to be $3,239,464.

3.2.5 Alternative 3

SMF 1202C is a 6.31-acre dry retention pond located on the left side of the roadway from Station 1180+64 to Station 1186+97. Runoff will be conveyed through roadside ditches and storm drain systems to this SMF, which discharges to the wetland east of this SMF.

The estimated ground elevation at SMF 1202C is 115.0 feet, with a proposed LEOP of 114.5 feet and a SHGWT elevation of 110.2 feet. The previous presumptive treatment volume is 0.41 acre-feet, while 1.53 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume is 10.01 acre-feet, while 10.57 acre-feet is provided. Nutrient removal rates provided by SMF 1202C are 84% of Total Nitrogen (TN) and 84% of Total Phosphorus (TP).

The predominant soil at this location is Satellite Sand [14], which are classified as Hydrologic Soil Group A. The land use in the SMF footprint is [2200] Tree Crops. Recorded historical resources at this location are rated Medium. The hazardous material risk rating is Medium. This site has a High potential to impact protected, threatened, or endangered species, with a species mitigation cost of $82,200. No wetland or conservation land impacts are anticipated with this alternative.

There are no Section 4(f) areas located near the site. A Florida Gas Transmission (FGT) gas pipeline is present near the site, with potential impacts. One parcel is affected, requiring a partial take (P). There are

EXECUTIVE SUMMARY

The Florida Department of Transportation (FDOT) proposes to improve a segment of State Road 70 (SR 70) in Highlands County, Florida. The project is also being referred to as SR 70 Segment 12. This report documents the Stormwater Management Facility (SMF) and Floodplain Compensation Site (FPC) alternatives evaluated to meet federal, state, and local stormwater management requirements.

The existing roadway typical section includes a two-lane, undivided roadway with 12-foot travel lanes and an outside shoulder width of 10 feet (4-foot paved). The proposed roadway typical section will widen SR 70 from two to four lanes throughout the study limits.

The SMF alternatives were developed to accommodate the proposed improvements while meeting the applicable stormwater treatment and attenuation criteria. The FPCs have been developed to compensate the floodplain encroachments from the proposed roadway improvements. The vertical datum for this project is the North American Vertical Datum of 1988 (NAVD88). Elevations may be converted to the National Geodetic Vertical Datum of 1929 (NGVD29) by adding a conversion factor of 1.20 feet (NGVD29 = NAVD88 + 1.20').

This Pond Siting Report is being prepared in support of the SR 70 Project Development and Environment (PD&E) study being completed within the subject project limits under FPID# 414506-1-22-01. Please note, as this project is being completed as a PD&E and Design overlap project, it is incorporating Design-level data collection, and the project design prepared under FPID# 414506-4-32-01 (US 27 to County Road 29). This Pond Siting Report is preliminary in nature and serves as an engineering tool to identify and compare potential SMF and FPC sites using an alternatives-based evaluation methodology. The recommendations are based on preliminary estimates and factors summarized in the analysis matrix for each site. These sites were screened using available data and engineering judgment. The drainage basin boundaries, pond sizes, and calculations included in this report are subject to refinement during subsequent phases of project development and design.

The project lies within the Lake Placid and Harney Pond Canal watersheds. The segment is divided into four proposed roadway drainage basins for the purpose of analysis and reference. In existing conditions, stormwater runoff is generally conveyed via ditches and cross drains to receiving waters and wetlands adjacent to the corridor. There are six existing ponds along the project due to the previous addition for the Georgia Pacific Access Road project under ERP # 44026106.001 and the SR 70/US 27 intersection improvement project under ERP # 4325519.001. The proposed improvements are intended to maintain existing drainage patterns and outfalls as much as feasible.

Within Segment 12, two impaired water bodies are present:

- **Lake Placid Outlet (WBID: 1938Y)** – Impaired for dissolved oxygen.
- **Harney Pond Canal (WBID: 3204)** – Impaired for nutrients and dissolved oxygen.

Additionally, Basin 1201 discharges to the Placid Lakes Highlands Outstanding Florida Water (OFW).

SMF and FPC alternatives were developed in accordance with design criteria outlined in the latest editions of FDOT's Drainage Manual and the Southwest Florida Water Management District (SWFWMD) Environmental Resource Permit (ERP) Applicant's Handbook. Key criteria include:

- SMFs must provide a minimum 80% reduction of average annual loading of both Total Nitrogen (TN) and Total Phosphorus (TP) for impaired waterbody.
- SMFs must provide a minimum 95% reduction of average annual loading of both Total Nitrogen (TN) and Total Phosphorus (TP) for impaired waterbody and discharging to OFW.
- Encroachment to the 100-year floodplain requires equivalent compensating storage between the seasonal high water level and the 100-year floodplain elevation.

Each SMF alternative was evaluated considering impacts to cultural and environmental resources, potential hazardous material sites, right-of-way requirements, and stormwater performance metrics.

Each FPC alternative was evaluated for each encroachment to the 100-year floodplain as defined by the Lake Placid Watershed Interconnected Channel and Pond Routing (ICPR) model or other best available information as described in the report below. FPC sites were recommended according to several factors: cultural resources such as historic structures and archaeological features, environmental impacts including wetlands, upland habitat, and protected species, hazardous materials contamination, economic factors including estimated right-of-way acquisition and construction costs. Considered alternatives within this report include "cup for cup" compensation sites. However, upon the selection of the preferred FPC site, detailed modeling of the 100-year floodplain will be conducted to further reduce and refine the size of the preferred alternative.

Drainage maps can be found in Appendix 6, and SMF and FPC alternatives are provided in the tables found in Section 3 and 4.

1 PROJECT OVERVIEW

1.1 Project Description

The Florida Department of Transportation (FDOT) proposes to improve a segment of State Road 70 (SR 70) from S. Jefferson Avenue to US 27 in Highlands County, Florida. The project is also being referred to as SR 70 Segment 12. The existing roadway typical section includes a two-lane, undivided roadway with 12-foot travel lanes and an outside shoulder width of 10 feet (4-foot paved). The proposed project will widen SR 70 from two to four lanes throughout the study limits.

The proposed typical section from Station 1039+53 to Station 1153+80 is a four-lane flush shoulder roadway with 12-foot travel lanes, 10- to 12-foot (5-foot paved) outside shoulders, 4-foot paved inside shoulders, paved median with guardrail, and roadside ditches. A 12-foot shared use path is also proposed along the southern side of the roadway.

The proposed typical section from Station 1153+80 to Station 1271+50 is a four-lane flush shoulder roadway with 12-foot travel lanes, 12-foot (5-foot paved) outside shoulders, 4-foot paved inside shoulders, type E median curbs, and roadside ditches. A shared use path with a variable width of 10 to 12 feet is proposed along the southern side of the roadway.

1.2 Purpose

The purpose of this project is to improve operational conditions for emergency evacuations along the SR 70 corridor from Jefferson Avenue to US 27. This Pond Siting Report is being prepared in support of the SR 70 Project Development and Environment (PD&E) study being completed within the subject project limits under FPID# 414506-1-22-01. Please note, as this project is being completed as a PD&E and Design overlap project, it is incorporating Design-level data collection, and the project design prepared under FPID# 414506-4-32-01 (US 27 to County Road 29). This report presents the Stormwater Management Facility (SMF) and Floodplain Compensation Site (FPC) alternatives evaluated to satisfy federal, state, and local stormwater management requirements.

Reports and Studies

- Watershed Evaluation, Floodplain Analysis and Master Plan Report for Lake Placid (L473) Watershed (2014) by Brown and Caldwell Corporation
- Lake Placid Watershed Model Migration – Final Model Conversion Results Technical Memorandum (2022) by Wood Environmental & Infrastructure Solutions, Inc.

- Drainage Design Report – SR 25 (US 27) at SR 70 Intersection Improvements (FPID 439827-1) (2019) by Dewberry Engineers Inc. – ERP Permit No. 25519.001 – Appendix 9
- State Road 70 Georgia-Pacific Turn Lane Pre/Post Construction Basin Runoff Summary– ERP Permit No. 26106.001 – Appendix 9

2.2 Existing Drainage Patterns

An assessment of the existing conditions and drainage patterns was performed along the Segment 12 corridor. Available resources reviewed for this assessment included regional watershed studies, historical drainage maps, Florida Geographic Information Office (FGIO) Light Detection and Ranging (LiDAR) data, Highlands County contours, FEMA Flood Insurance Rate Maps (FIRMs), existing SWFWMD permits, and USGS quadrangle maps. Field reviews were conducted to verify the physical topography and the existing drainage basin outfalls within the project area.

The project is located within the Lake Placid and Harney Pond Canal watersheds. For analysis and reference purposes, this segment has been divided into four drainage basins based on the natural topography and observed drainage divides. In existing conditions, stormwater runoff is generally conveyed via ditches and cross drains to receiving waters and wetlands adjacent to the corridor. There are six existing ponds along the project due to the previous addition for the Georgia Pacific Access Road project under ERP # 44026106.001 and the SR 70/US 27 intersection improvement project under ERP # 4325519.001. Relevant excerpts from these ERPs can be found in Appendix 9.

Within the Segment 12 limits, all drainage basins ultimately discharge into either Lake Placid Outlet (WBID: 1938Y), which is impaired for dissolved oxygen, or Harney Pond Canal (WBID: 3204), which is impaired for nutrients and dissolved oxygen. The project corridor lies within the boundaries of the Lake Okeechobee Basin Management Action Plan (BMAP), which includes regulatory provisions for nutrient reduction and water quality protection. Additionally, Basin 1201 discharges into the Placid Lakes Highlands Outstanding Florida Water (OFW).

Table 2-1 Existing Pond Storage

Permit Begin STA	Permit End STA	CL SR 70 Begin STA	CL SR 70 End STA	Basin (Pre/Post)	Permit No.	Storage Name	Dry/Wet	Existing Treatment Vol. (Ac-Ft)	Existing Attenuation Vol. (Ac-Ft)
37+02	38+00	1228+68	1230+22	4-1/1203	26106.001	Basin 4	Dry	0.023	0.000
30+50	31+25	1235+35	1236+34	4-1/1203	26106.001	Basin 3	Dry	0.048	0.000
26+76	27+50	1239+27	1240+01	4-1/1203	26106.001	Basin 2	Dry	0.050	0.000
21+50	23+50	1243+13	1245+00	4-1/1203	26106.001	Basin 1	Dry	0.046	0.000
217+60	225+00	1258+10	1262+67	5-3/1204	25519.001	Swale SW	Dry	0.079	0.000
223+80	225+00	1264+36	1265+52	5-2/1204	25519.001	Swale NW	Dry	0.019	0.000

An aerial-based regional drainage map is included in Appendix 6. See Appendix 1 for a map of the WBID boundaries within Segment 12.

2.3 Tailwater

Tailwater and outfall conditions were established using the following sources:

- The downstream nodes within the Lake Placid Watershed model.
- The seasonal high water elevations as determined from geotechnical borings by Tierra, Inc., surveyed biological indicators, or surface water gauge data.

2.4 Floodplain

The Lake Placid Watershed Interconnected Channel and Pond Routing (ICPR) model was used to determine the 100-year floodplain elevation for most of the project area. The watershed model basin extends along SR 70 from the beginning of the project and ends near Station 1246+70. Except for Lake Annie, the applicable FEMA FIRMs (community-panel numbers 12055C0510C, 12055C0528C, and 12055C0529C, effective November 18, 2015) show the 100-year flood hazard areas along the project corridor are designated as Zone A, which means that no base flood elevations have been determined. Lake Annie is designated as Zone AE, where the base flood elevation has been determined to be 112.27 feet NAVD 1988. Refer to the FEMA FIRM in Appendix 1. Since no base flood elevations have been determined, the watershed model represents the best available information.

The watershed model was originally created in ICPR version 3 (ICPR3) but was converted to ICPR version 4 (ICPR4) by Wood Environmental & Infrastructure Solutions, Inc. in July 2022. HNTB received both models from the SWFWMD and performed an initial comparison of the output stages for the 100-year/1-day storm event. The results of comparison concluded that the output was inconsistent with the findings from the Lake Placid Watershed Model Migration – Final Model Conversion Results Technical Memorandum. HNTB contacted the SWFWMD's Engineering and Watershed Management Section and was advised to use the ICPR3 version as the best available information. Since ICPR3 is no longer supported by Streamline Technologies, Inc., HNTB converted the ICPR3 model to ICPR4 and made the following adjustments in ICPR3 to address differences between both versions:

- Reduced the hydrology time increment to 2 minutes.
- Set the friction equation of all channel, pipe, and drop structure links to "Automatic".
- Set the solution algorithm of all pipe and drop structure links to "Most Restrictive".
- Set the percolation links to "Vary Based on Stage/Area Table".
- Verified that the top stage/area elevation for nodes within the project boundary were greater than the 100-year/24-hour max stage elevations. No changes to the stage/area tables were required.

The watershed model was converted to ICPR4 and results from the 100-year/24-hour simulation was compared to ICPR3. The results were much more consistent and aligned with the Lake Placid Watershed Model Migration – Final Model Conversion Results Technical Memorandum.

The ICPR4 watershed model was further refined to reflect additional data collected along the project corridor and fix issues with the SWFWMD Governing Board's approved watershed model.

Initial stages were evaluated along the project corridor and were updated to mimic actual conditions based on a combination of collected data including aerial photographs, permitted documents, environmental assessments, field review notes, surface water gauges, and geotechnical borings. Attention was given to areas where surface waters and permitted stormwater management facilities exist.

The model network was updated at several locations to contain the increased initial stages within the respective node and prevent an initial drawdown of the nodal pool. Refinements to the model are summarized below:

- Node NLP0002B was created in Basin BLP0002. Invert elevations for Pipe Links LLP23329 and LLP23329 were updated to match the surveyed data. Weir LLP23085A was created with a cross-sectional control elevation of 134.57 feet.
- Node NLP0477B was created in Basin BLP0477. A stage/area table was created and overland Weir LLP23084A was created with a cross-sectional control elevation of 130.60 feet.

- The invert elevations and max depth (pipe diameter) for Pipe Link LLP23339 were updated to match the surveyed data. The upstream invert elevation for Channel Link LLP23057 was modified to match the surveyed pop-off elevation.
- At some locations such as Nodes NLA0347 and NLA0347A, the initial stages were increased but were limited by the downstream control elevation.

Manual basins BLP0086 and BLP0375 did not report stormwater runoff upon execution of the simulation. This issue was part of the original Governing Board's approved watershed model in ICPR3 and was carried over when the SWFWMD converted the model to ICPR4. Upon review of the model inputs, there were no apparent issues with the impervious and green-ampt set tables, so both basins were recreated based on the curve number method. The simulation was run again and both basins reported stormwater runoff.

2.5 Rules and Regulatory Agency Coordination

2.5.1 Permits

The project is located within the SWFWMD and South Florida Water Management District (SFWMD). An interagency agreement, executed March 24, 2018, delegated the permitting authority for the entire limits of the project to the SWFWMD. An ERP will be obtained from the SWFWMD. See the pre-application meeting minutes in Appendix 2.

2.5.2 Water Quality (Treatment)

Given the Location and Design Concept Approval (LDCA) is anticipated to be after June 28, 2026, the project will follow the stormwater quality nutrient permitting requirements that became effective on June 28, 2024. The stormwater treatment criteria within the Segment 12 project limits follow the Southwest Florida Water Management District (SWFWMD) requirements, which include:

1. A wet detention system shall provide ½ inch of detention runoff (mixing volume) from the contributing area in 24 hours.

2. The design overflow elevation in wet ponds shall not exceed 10 inches above the control elevation (orifice elevation or seasonal high water (SHW) level).

Within the project limits, two impaired water bodies have been identified:

- Harney Pond Canal (WBID: 3204) – Impaired for nutrients and dissolved oxygen.

- Lake Placid Outlet (WBID: 1938Y) – Impaired for dissolved oxygen, copper, and lead.

All drainage basins within Segment 12 discharge into Harney Pond Canal and Lake Placid Outlet. One basin in this segment discharges to Placid Lakes Highlands, which is an Outstanding Florida Water (OFW). This project lies within the boundaries of the Lake Okeechobee Basin Management Action Plan (BMAP), which requires compliance with additional nutrient reduction measures for impaired watersheds.

Therefore, the SMF will provide a level of treatment sufficient to accomplish:

1. An 80 percent reduction of average annual loading of Total Phosphorus (TP) and Total Nitrogen (TN) from the proposed project, or a 95 percent reduction of average annual loading of TP and TN when located upstream of the OFW; and

2. A reduction such that the post-development condition average annual loading of nutrients does not exceed the predevelopment condition nutrient loading.

2.5.3 Water Quantity (Attenuation)

For basins with a positive outfall, or open basins, SWFWMD will require the post-development peak discharge rate from the basin be less than or equal to the pre-development peak discharge rate for the 25-year/24-hour SWFWMD storm event.

For basins without a positive discharge, or closed basins, the project shall also retain the pre versus post runoff volume for the 100-year/24-hour SWFWMD storm event and the 100-year/240-hour FDOT storm event.

Rainfall depths for open basins were obtained from the rainfall maps provided in the SWFWMD Applicant's Handbook, while the rainfall depths for closed basins were obtained from NOAA Atlas 14 data in accordance with FDOT criteria.

2.5.4 Drainage Design Criteria

A summary of the drainage design criteria is included in Table 2-2.

Table 2-2 Summary of Drainage Design Criteria

STORMWATER MANAGEMENT

Detention & Retention Ponds	Maintenance Berm	Horizontal Clearance	20 ft Minimum	DM Sect. 5.4.4.2
		Slope	1:8 or Flatter (For At Least 15 ft Adjacent to Pond)	
	Corners		30 ft Minimum Turning Radius (At Maintenance Berm's Inside Edge)	
	Freeboard	Offsite Ponds	1.0 ft Minimum	
		Linear Ditches	0.5 ft Minimum	
	Fencing		Side Slope ≥ 1:4	
Floodplain Compensation Areas (FCA)	Side Slopes		1:4 or Flatter	DM Sect. 5.4.4.3

Note:
DM denotes FDOT Drainage Manual (January 2025).
The information presented in this table are subject to change until final Phase of the project.

2.5.5 Coordination with Florida Gas Transmission (FGT)

Potential impacts to the FGT gas line and associated easement will be further evaluated in accordance with the Global Settlement Agreement between FDOT and FGT. This agreement outlines coordination requirements and conditions under which the FGT facilities may need to be relocated or protected during construction. For any SMF or FPC alternatives located within or adjacent to the FGT easement, coordination with FGT will occur during the Concept Design phase following preferred site selection.

2.6 Geotechnical Information and Project Soil Conditions

2.6.1 Soil Characteristics

A review of the USDA NRCS Highlands County Soil Survey was conducted to assess the general soil characteristics within the project area. The survey provides hydrologic soil group (HSG) classifications, estimated seasonal high groundwater table (SHGWT) depths, and drainage characteristics that influence stormwater management facility (SMF) and floodplain compensation (FPC) performance.

To validate the soil survey data, geotechnical borings were conducted by Tierra, Inc. at each proposed SMF and FPC location. These borings confirmed site-specific SHGWT elevations and provided additional insights into subsurface conditions. The geotechnical findings, along with the Highlands Soil Survey, are included in Appendix 5.

Table 2-3 summarizes the primary soil types, HSG classifications, and estimated SHGWT depths for each drainage basin.

Table 2-3 Project Soil Conditions

Basin	Map Unit	Soil Name	Hydrologic Soil Group	Estimated SHGWT Depth (ft)
1201	5	Daytona Sand	A	3.5 - 5.0
	7	Placid Fine Sand	A/D	0.0
	11	Orsino Sand	A	4.0 - 5.0
	12	Basinger Fine Sand	A/D	0.0 - 1.0
	14	Satellite Sand	A	1.5 - 3.5
	28	Archbold Sand	A	3.5 - 6.0
1202	10	Myakka Fine Sand	A/D	0.5 - 1.5
	11	Orsino Sand	A	4.0 - 5.0
	12	Basinger Fine Sand	A/D	0.0 - 1.0
	14	Satellite Sand	A	1.5 - 3.5
	21	Hontoon Muck	A/D	0.0
	28	Archbold Sand	A	3.5 - 6.0
1203	5	Daytona Sand	A	3.5 - 5.0
	9	Astatula Sand	A	>6.67
	10	Myakka Fine Sand	A/D	0.5 - 1.5
	12	Basinger Fine Sand	A/D	0.0 - 1.0
	14	Satellite Sand	A	1.5 - 3.5
	21	Hontoon Muck	A/D	0.0
	47	Astatula Sand	A	>6.67
1204	1	Paola Sand	A	>6.67
	9	Astatula Sand	A	>6.67

Note:
The information presented in this table are subject to change until final Phase of the project.

2.6.2 Curve Numbers

Curve Numbers (CNs) were assigned based on land use conditions and HSG classifications from the USDA NRCS Highlands County Soil Survey. The values were taken from Table B-7 of the FDOT Drainage Design Guide and reflect existing and proposed conditions.

CN values were determined using NRCS land use classifications, with adjustments for soil type, impervious coverage, and anticipated moisture conditions. The final CN values applied in Hydrologic and Hydraulic (H&H) modeling are summarized in Table 2-4.

Table 2-4 Curve Numbers Summary

Land Use Description	Hydrologic Soil Group			
	A	B	C	D
Pasture				
Poor Condition	68	79	86	89
Good Condition	39	61	74	80
Open Spaces				
Good Condition	68	79	86	89
Fair Condition	49	69	79	84
Poor Condition	39	61	74	80
Impervious	98			
Open Water	100			

Note:
The information presented in this table are subject to change until final Phase of the project.

2.6.3 Geotechnical Investigation

To support the stormwater management facility (SMF) and FPC site selection process, Tierra, Inc. conducted geotechnical borings at each proposed SMF and FPC location. These investigations provided site-specific verification of SHGWT elevations, soil permeability, and subsurface conditions to confirm the feasibility of the proposed SMF alternatives.

The results were compared against the USDA NRCS Highlands County Soil Survey to identify any discrepancies and refine the pond siting process. The geotechnical findings also informed hydrologic and hydraulic modeling, ensuring compliance with FDOT and SWFWMD stormwater design criteria.

The preliminary geotechnical borings data, along with the Highlands County Soil Survey, is included in Appendix 5 for reference.

2.7 Base Clearance Water Elevation Consideration

Per FDOT requirements, a minimum three-foot clearance must be maintained between the Base Clearance Water Elevation (BCWE) and the roadway base course at the low edge of pavement (LEOP). In areas where linear ponds are implemented, the three-foot clearance is typically measured from the weir elevation of the linear ponds rather than from the SHGWT. Per FDOT Drainage Manual Section 5.4.1.5, a lower elevation may be used if (i) in-situ soils are classified as Hydrologic Soil Group A; (ii) geotechnical investigation reveals there is no confining layer to impede drawdown; and (iii) construction activities are limited within the treatment swale to avoid compaction and tracking of silt and muck.

The majority of the linear ponds identified in this PSR are located within in-situ soils with HSG A;

however, some are located in HSG A/D. A design deviation request has been discussed with the District Drainage Engineer and will be further coordinated. Therefore, the cost estimate for the linear pond alternative does not include roadway profile adjustment.

2.8 Environmental Analysis

A multidisciplined environmental analysis was performed for each pond alternative, including desktop cultural resources investigations, Level I contamination screenings, evaluation of potential impacts to threatened and endangered species, and estimates of potential wetland impacts. The results of the environmental analysis are both qualitative and quantitative. Qualitative ratings, such as high, medium, or low apply to cultural resources and contamination. Mitigation credit costs were applied to the estimated impacts to wetlands, and threatened and endangered species, and are included with the total cost for each alternative.

2.8.1 Historical and Archaeological Assessment

One National Register of Historic Places (NRHP)-eligible resource, the South Central Florida Express (CSX Railroad) (8HG01115), is located just west of Old SR 8 within the area of potential effect (APE). This segment of the South Central Florida Express (CSX Railroad) (8HG01115) was determined eligible for listing in the NRHP by the SHPO in 2020. The project plans show minimal drainage work within the railroad ROW. In general, the areas identified for the SR 70 roadway improvements and pond site alternatives are considered to have a low to medium risk of impact to archeological and historical resources. However, several alternatives have been noted to have a high potential due to proximity to previously documented archaeological sites. Evaluation of the project's potential involvement with archaeological and historical resources is on-going and will be documented in the PD&E study's Cultural Resources Assessment Survey for Stormwater Ponds and Floodplain Compensation Facilities.

2.8.2 Hazardous Material Assessment

A desktop screening of the areas identified for the SR 70 roadway improvements and pond/floodplain site alternatives for potential sources of contamination and hazardous materials identified several potential sources that may require further Level II or Level III Screening. Identified potential sources with an elevated, medium risk are summarized in Table 2-5. Evaluation of the project's potential involvement with potential contamination is on-going and will be documented in the PD&E study's Contamination Screening Evaluation Report for Stormwater Ponds and Floodplain Compensation Facilities.

Table 2-5 Medium Risk Contamination Summary

Source Description	
Railroad	Medium
Citrus groves	Medium
Storage tank unknowns and documented stained soil	Medium-High
Petroleum cleanup site	Medium-High

For sites determined to have a risk rating of "Medium" or "High," Level II field screening will be conducted if it is determined during the project's design that its construction activities could be within their vicinity. These sites have been determined to have potential contaminants, which may impact the project corridor. A soil and groundwater sampling plan will be developed for each site, if applicable. The sampling plan will provide sufficient detail as to the number of soil and groundwater samples to be obtained and the specific analytical test to be performed. A site location sketch for each facility showing all proposed boring locations and groundwater monitoring wells will be prepared. Level II sampling activities will be coordinated with the District Contamination Impact Coordinator (DCIC).

2.8.3 Wetland and Vegetative Cover

Wetland and other surface water boundaries were reviewed in both desktop and field evaluations in conformance with the federal and state criteria promulgated in the Corps of Engineers Wetlands Delineation Manual, the Regional Supplement to the Corps of Engineers Wetlands Delineation Manual: Atlantic and Gulf Coastal Plain Region: Version 2, the Florida Wetlands Delineation Manual, and Rule 62-340, F.A.C., Delineation of the Landward Extent of Wetlands and Surface Waters. Wetlands have been delineated adjacent to the proposed SR 70 roadway widening limits and additional areas where pond siting and floodplain compensation alternatives are anticipated. Consistent with 62.345 F.A.C., a Uniform Mitigation Assessment Methodology (UMAM) functional loss analysis was performed on representative wetland impact areas. The project's wetland impact analysis is on-going and will be documented in the PD&E study's Natural Resources Evaluation report, as well as provided in support of the environmental resource permitting and future PD&E re-evaluation documentation as appropriate. Wetland impacts which will result from the construction of this project will be mitigated pursuant to Section 373.4137, F.S., to satisfy all mitigation requirements of Part IV of Chapter 373, F.S., and 22 United States Code (U.S.C.) § 1344.

For planning-level cost estimating, a wetland mitigation unit cost of $100,000 per acre was applied. This estimate is based on a standardized UMAM-based approach using publicly available wetland data and average market credit prices from mitigation banks across Florida. Using the National Wetlands Inventory (NWI), preliminary wetland impacts were estimated based on wetland type, connectivity, and aerial signature. These wetlands were assigned an average UMAM score of 0.5 (corresponding to a mid-range ecological value of 5 on a 1–10 scale). Discussions with wetland mitigation banks indicated a typical

credit price of approximately $200,000 per UMAM credit. Applying a 0.5 UMAM score to this average price results in an estimated mitigation cost of $100,000 per wetland acre impacted. This preliminary cost assumption provides a reasonable planning-level estimate for use in comparing pond siting alternatives.

2.8.4 Habitat Assessment

Based on the information collected, field reviews, and species-specific surveys conducted for this project, a list of protected species with the potential to occur within the project study area was generated. This list includes federal or state protected species that have the potential for occurrence within the project study area. These protected species include plants, invertebrate, reptiles, birds, and mammals. The project's involvement with listed/protected species and their habitats is on-going and will be documented in the PD&E study's Natural Resources Evaluation report, as well as provided in support of the environmental resource permitting and future PD&E re-evaluation documentation as appropriate. To the extent feasible, the FDOT will complete species-specific mitigation activities prior to the commencement of construction.

2.8.5 Wildlife Crossings

It is the intent for this corridor to provide opportunities for wildlife crossings. These passages will enhance wildlife connectivity that was severed by the construction of SR 70. Wildlife crossing siting opportunities were evaluated along the SR 70 corridor. Consideration of appropriate locations were analyzed through Geographic Information System (GIS) data, which included current aerials, Florida Land Use, Cover and Forms Classification System (FLUCFCS), National Wetlands Inventory (NWI), US Fish and Wildlife Service (USFWS) and Florida Fish and Wildlife Conservation Commission (FWC) species data and coordination with District staff. These data sources were overlayed on current aerials and follow up field inspections were conducted to validate potential crossing locations identified during the desktop review. Undeveloped areas with natural systems on both sides of SR 70 such as wetlands and creek systems were considered an important factor in the analysis. While the western bridge crossing is intended to benefit large mammals (Florida panther and black bear), the other culvert crossings will provide an opportunity for the movement of amphibian, reptile, and small mammal species. Infrastructure improvements for environmental access and attractants which may include raised ditch bottom inlets to serve as sky lights, so that the crossings are punctuated by natural light at several points and specialized grading and/or materials at the culvert ends to provide traversable pathways.

It is the design intent for the new wildlife crossings inverts to be set above estimated SHGWT to be generally dry and accessible during normal conditions. However, during large storm events, these pipes do convey flows between the adjacent areas north and south of SR 70. Table 2-6 provides a summary of the proposed wildlife crossings.

Table 2-6 Wildlife Crossing Summary

No.	Station	Description	Length (ft)
1	1054+80	29”x45” ECP	224
2	1137+50	Bridge	110
3	1168+80	29”x45” ECP	210
4	1201+50	16'x6.5' CBC	155

3 ALTERNATIVE STORMWATER MANAGEMENT FACILITY (SMF) SITES

The project is located within the Lake Placid Watershed and the Harney Pond Canal Watershed. For the purpose of analysis and reference, the project corridor is divided into 4 existing drainage basins and 4 proposed roadway basins. There are six existing ponds along the project due to the previous addition for the Georgia Pacific Access Road project under ERP # 44026106.001 and the SR 70/US 27 intersection improvement project under ERP # 4325519.001.

In the existing condition, stormwater generally sheet flows offsite and is conveyed through cross drains and roadside ditches to receiving wetlands and water bodies located adjacent to the project corridor. The proposed condition will maintain the existing drainage flow paths and outfalls.

Within the project limits, two impaired water bodies have been identified:

1. Lake Placid Outlet (WBID 1938Y) – Impaired for dissolved oxygen.
2. Harney Pond Canal (WBID 3204) – Impaired for nutrients and dissolved oxygen.

Additionally, Basin 1201 discharges to Placid Lakes Highlands Outstanding Florida Waters (OFW).

The following sections describe each basin with its SMF alternatives and a summary of the analysis. The existing and proposed drainage patterns for each basin are illustrated in the drainage maps included in this section and Appendix 6. The preliminary configuration and calculations for each SMF alternative are also included in Appendix 3.

The SMF alternatives were analyzed and evaluated for cultural resources such as historic structures and archaeological features; environmental impacts including wetlands, upland habitat, and threatened and endangered (T/E) species involvement; petroleum and hazardous materials contamination; economic factors including acquisition of right-of-way and special construction; and hydrologic and hydraulic characteristics. The right-of-way cost is evaluated by the FDOT District 1 ROW Department with supporting documentation of cost estimates is included in Appendix 7. The preferred SMF sites will be reviewed in a title search for any easements. This review will continue during the design phase of the project.

Considered Alternatives

Offsite Ponds:

Offsite ponds were considered for each basin within the project area and are included in the following comparison of SMF alternatives.

Linear Ponds:

Multiple linear ponds were considered in some basins within the project area and are included in the following comparison of SMF alternatives. The typical linear pond cross section is assumed to have a 1:6 front slope, 1:4 back slope, and a minimum 5-foot bottom width, with geometry adjusted as needed to match available ROW and longitudinal grade. The bottom of every linear pond was set at least 1' above the SHGWT elevation.

The control elevation for each SMF alternative was established based on site-specific conditions, including groundwater elevations from geotechnical borings and tailwater conditions from the Lake Placid Watershed model. For dry ponds, the seasonal high groundwater table (SHGWT) determined at each site governs the proposed control elevation. For wet ponds, the control elevation is typically set at or above the SHGWT unless favorable downstream tailwater conditions exist. In such cases, the use of a pond liner may be considered to lower the control elevation below the SHGWT; however, liners are generally avoided due to potential long-term maintenance concerns. The control elevation source for each SMF is documented in Appendix 3.

3.1 Basin 1201

3.1.1 Pre-Development Analysis

Basin 1201 is an open basin that extends from Station 1041+19.15 to Station 1161+09.94 along both the left and right sides of SR 70. In the existing condition, stormwater runoff from the roadway and surrounding areas generally sheet flows offsite into adjacent swales and roadside ditches. The runoff is conveyed toward downstream low-lying areas and natural drainage features beyond the project limits. According to the USDA NRCS Highlands County Soil Survey, predominant soil types in Basin 1201 include Archbold Sand [28], Orsino Sand [11], and Satellite Sand [14], all within Hydrologic Soil Group A. Seasonal high water table (SHGWT) elevations vary throughout the basin, generally ranging from 0.0 to 6.0 feet below ground surface. Drainage maps are included under Appendix 6. The ICPR nodal diagram for Basin 1201 is provided in Appendix 1.

3.1.2 Post-Development Analysis

Proposed improvements along SR 70 include roadway widening and the addition of a shared use path within Basin 1201. Stormwater runoff from the improved roadway will be collected through a combination of roadside ditches and closed storm drain systems and conveyed to the selected stormwater management facility (SMF) alternative for treatment and attenuation. The design maintains the existing drainage flow paths and outfalls.

3.1.3 Alternative 1

Alternative 1 consists of multiple linear ponds (SMF 1201D) located within the proposed roadway right-of-way, which collect and convey runoff to a downstream wet detention pond (SMF 1201A) for treatment and attenuation. The area of SMF 1201D is 8.11-acre, and SMF 1201A is 8.06-acre. SMF 1201D is located on the right side of the roadway between Station 1050+00 and Station 1160+10, while SMF 1201A is located on the right side of the roadway between Station 1124+28 and Station 1131+00. No additional easements are required for SMF 1201A, as it is intended to function in conjunction with FPC 1208A, which shares the same parcel. No easements are needed for SMF 1201D.

The estimated ground elevation at SMF 1201A is 118.0 feet. The proposed low edge of pavement (LEOP) within the basin is 117.8 feet. The SHGWT for SMF 1201A is 114.7 feet. The previous presumptive treatment volume is 1.35 acre-feet, while 7.58 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume is 13.54 acre-feet, while 19.50 acre-feet is provided. To accommodate for hydraulic head, additional volume beyond the required attenuation volume is provided above the linear treatment cells. Nutrient removal rates provided by SMF 1201A and SMF 1201D are 95% of Total Nitrogen (TN) and 97% of Total Phosphorus (TP).

The soils at these locations are Orsino Sand [11], Basinger Sand [12], Satellite Sand [14], and Archbold Sand [28], which are in Hydrologic Soil Groups A and A/D. The land use for SMF 1201A is [2210] Citrus Groves, while SMF 1201D lies within the proposed roadway right-of-way. There are no floodplain impacts; therefore, no compensation cost is required. Wetland impacts from SMF 1201D are 0.01-acre with no mitigation cost. No wetland impacts are anticipated for SMF 1201A.

Recorded historical resources at this alternative are rated “Low” for SMF 1201A. The hazardous material risk rating is “Medium” for SMF 1201A. This alternative has a “High” potential to impact protected, threatened, or endangered species, with a species mitigation cost of $257,890 for SMF 1201A. Both SMF 1201A and SMF 1201D are located within a Section 4(f) resource (LWRWEA), but only SMF 1201D requires mitigation. The conservation impact is 29.75-acre with no cost.

For Alternative 1, SMF 1201D, all proposed linear ponds are located entirely within the proposed roadway right-of-way. As such, species mitigation, conservation mitigation, and wetland mitigation costs do not contribute to the total cost of the alternative, as these impacts are considered consistent throughout the proposed right-of-way of Basin 1201.

Major utilities including Florida Gas Transmission (FGT) gas pipeline and Florida Power and Light (FPL) transmission line are present, with potential impacts for SMF 1201A and 1201D. One parcel is impacted requiring a partial take (P). Total estimated cost is $4,131,027.

3.1.4 Alternative 2

Alternative 2 consists of multiple linear ponds (SMF 1201E) within the proposed roadway right-of-way, which collect runoff and convey it to a downstream wet detention pond (SMF 1201B) for treatment and attenuation. SMF 1201E has an area of 9.54 acres, and SMF 1201B is 5.53 acres. SMF 1201E is located on the right side of the roadway from Station 1042+90 to Station 1160+10, and SMF 1201B is located on the right side of the roadway from Station 1146+07 to Station 1153+77. No additional easements are required for SMF 1201B, as it is intended to function in conjunction with FPC 1208B, which shares the same parcel. No easements are needed for SMF 1201D.

The estimated ground elevation at SMF 1201B is 117.0 feet. The proposed LEOP within the basin is 117.8 feet. The SHGWT for SMF 1201B is 113.9 feet. The previous presumptive treatment volume is 1.35 acre-feet, while 7.78 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume is 12.32 acre-feet, while 20.21 acre-feet is provided. To accommodate for hydraulic head, additional volume beyond the required attenuation volume is provided above the linear treatment cells. Nutrient removal rates provided by SMF 1201B and SMF 1201E are 95% of Total Nitrogen (TN) and 97% of Total Phosphorus (TP).

Soils at these locations include Daytona Sand [5], Orsino Sand [11], Basinger Sand [12], Satellite Sand [14], and Archbold Sand [28], which are in Hydrologic Soil Groups A and A/D. Land use for SMF 1201B is [2200] Tree Crops, while SMF 1201E lies within the proposed roadway right-of-way. Floodplain impacts and compensation costs are 0.21 acre-feet and $96,376, respectively. Wetland impacts from SMF 1201E are 0.01-acre with no mitigation cost. No wetland impacts are anticipated for SMF 1201B.

SMF 1201B is rated “Medium” for historical resources, and “Medium” for contamination risk. This alternative has a “High” potential to impact protected, threatened, or endangered species, with a species mitigation cost of $404,500 for SMF 120B. Both SMF 1201B and SMF 1201E are located within a Section 4(f) resource (LWRWEA), but only SMF 1201E requires mitigation. The conservation impact is 29.75-acre with no cost.

For Alternative 2, SMF 1201E, all proposed linear ponds are located entirely within the proposed roadway right-of-way. As such, species mitigation, conservation mitigation, and wetland mitigation costs do not contribute to the total cost of the alternative, as these impacts are considered consistent throughout the proposed right-of-way of Basin 1201.

Major utilities including Florida Gas Transmission (FGT) gas pipeline and Florida Power and Light (FPL) transmission line are present, with potential impacts for SMF 1201B and SMF 1201E. One parcel is impacted requiring a partial take (P). Total estimated cost is $4,755,814.

3.1.5 Alternative 3

Alternative 3 consists solely of multiple linear ponds (SMF 1201C) located within the proposed roadway right-of-way on the left and right side of the road from Station 1042+80 to Station 1160+20. Runoff from

the roadway is conveyed directly to these linear ponds for treatment and attenuation. The SMF area is 17.74 acres, with no easement required.

Estimated ground elevation and SHGWT elevation vary across the pond locations. The proposed LEOP within the basin is 117.8 feet. The previous presumptive treatment volume is 1.35 acre-feet, while 9.07 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume is 10.39 acre-feet, while 11.78 acre-feet is provided. To accommodate for hydraulic head, additional volume beyond the required attenuation volume is provided above the linear treatment cells. Nutrient removal rates provided by SMF 1201C are 95% of Total Nitrogen (TN) and 95% of Total Phosphorus (TP).

The soils at this location include Placid Sand [7], Orsino Sand [11], Basinger Sand [12], Satellite Sand [14], and Archbold Sand [28], in Hydrologic Soil Groups A and A/D. SMF 1201C lies within the proposed roadway right-of-way so there is no assigned land use. There are no additional floodplain impacts or compensation costs. Wetland impacts from SMF 1201C are 0.29-acre with no mitigation cost.

There are no recorded historic structures or contamination concerns. This alternative is within a Section 4(f) resource (LWRWEA) and impacts 29.75 acres of conservation lands with no mitigation cost. This alternative has a “High” potential to impact protected, threatened, or endangered species, with no species mitigation cost.

Major utilities including Florida Gas Transmission (FGT) gas pipeline and Florida Power and Light (FPL) transmission line are present, with potential impacts for SMF 1201C. Total estimated cost is $2,589,436.

Note:
The information presented in this table are subject to change until final Phase of the project.

3.1.6 Recommended SMF Site

SMF 1201A and SMF 1201D

PROS

1. No floodplain impacts

CONS

1. Second most expensive alternative
2. Requires deviation of FDOT criteria regarding base clearance

SMF 1201B and SMF 1201E

PROS

1. Second least SMF area required

CONS

1. Most expensive alternative
2. Most amount of species impacts
3. Most amount of floodplain impacts
4. Requires deviation of FDOT criteria regarding base clearance

SMF 1201C

PROS

1. Least expensive alternative
2. No floodplain impacts
3. No additional impacts beyond proposed roadway ROW

CONS

1. Requires deviation of FDOT criteria regarding base clearance

Recommendation

Based on an evaluation of total cost, wetland impacts, conservation land impacts, species mitigation, and SMF area, SMF 1201C is the preferred alternative for Roadway Basin 1201.

Supporting documentation, including the completed SMF comparison table and cost estimates, can be found above and in Appendix 7.

3.2 Basin 1202

3.2.1 Pre-Development Analysis

Basin 1202 is an open basin that extends from Station 1161+09.94 to Station 1209+44.58 along the left and right sides of SR 70. In the existing condition, stormwater runoff from the roadway sheet flows into adjacent roadside ditches and is conveyed toward natural drainage features located outside the project

corridor. According to the USDA NRCS Highlands County Soil Survey, the predominant soils in Basin 1202 include Archbold Sand [28], Satellite Sand [14], and Orsino Sand [11], all within Hydrologic Soil Group A, with estimated SHGWT values ranging from approximately 1.5 to 6.0 feet below ground surface. Drainage maps are included in Appendix 6. The ICPR nodal diagram for Basin 1202 is provided in Appendix 1.

3.2.2 Post-Development Analysis

The proposed improvements to SR 70 within Basin 1202 include roadway widening and the addition of a shared use path. Runoff from the improved roadway will be collected in roadside ditches and storm drain systems and conveyed to the selected stormwater management facility (SMF) for treatment and attenuation. The design maintains existing drainage patterns.

3.2.3 Alternative 1

SMF 1202A is a 2.55-acre dry retention pond located on the left side of the roadway from Station 1191+95 to Station 1195+01. Runoff will be conveyed to this SMF through roadside ditches and storm drain systems and will discharge to the wetland east of this SMF.

The estimated ground elevation at SMF 1202A is 118.5 feet, with a proposed LEOP of 114.5 feet and a SHGWT elevation of 110.1 feet. The required treatment volume is 0.41 acre-feet, while 1.82 acre-feet is provided. The required attenuation volume is 3.08 acre-feet, while 3.12 acre-feet is provided. To meet the minimum required nutrient removal rates, the treatment volume provided exceeds the presumptive requirement. Nutrient removal rates provided by SMF 1202A are 87% of Total Nitrogen (TN) and 87% of Total Phosphorus (TP).

The predominant soils at this location are Orsino Sand [11] and Satellite Sand [14], which are classified as Hydrologic Soil Group A. The land use in the SMF footprint is [2200] Tree Crops. Recorded historical resources at this location are rated Medium. The hazardous material risk rating is Medium. This site has a High potential to impact protected, threatened, or endangered species, with a species mitigation cost of $42,600. No wetland or conservation land impacts are anticipated with this alternative.

There are no Section 4(f) areas located near the site. A Florida Gas Transmission (FGT) gas pipeline is present near the site, with potential impacts. One parcel is affected, requiring a partial take (P). Estimated floodplain impacts are 0.08 acres, with a floodplain compensation cost of $22,811. Total cost is estimated to be $1,334,173.

3.2.4 Alternative 2

SMF 1202B is a 2.00-acre dry retention pond located on the left side of the roadway from Station 1192+93 to Station 1194+99. Runoff will be conveyed to this SMF through roadside ditches and storm drain systems and will discharge to the wetland located northeast of this SMF.

no floodplain impacts; therefore, no compensation cost is required. Total cost is estimated to be $1,615,606.

Note:
The information presented in this table are subject to change until final Phase of the project.

3.2.6 Recommended SMF Site

SMF 1202A

PROS	CONS
1. Least expensive alternative 2. Least amount of species impacts	1. Most amount of floodplain impacts

SMF 1202B

PROS	CONS
1. No floodplain impacts	1. Most expensive alternative 2. Most amount of species impacts 3. Most wetland impacts anticipated

SMF 1202C

PROS	CONS
1. No floodplain impacts	1. Second most expensive ROW cost 2. Second most expensive construction cost

Recommendation

Based on an evaluation of total cost, right-of-way cost, species mitigation cost, and floodplain impacts, SMF 1202A is the preferred alternative for Roadway Basin 1202.

Supporting documentation, including the completed SMF comparison table and cost estimates, can be found above and in Appendix 7.

3.3 Basin 1203

3.3.1 Pre-Development Analysis

Basin 1203 is an open basin that extends from Station 1209+44.58 to Station 1246+73.77 along both the left and right sides of SR 70. Under existing conditions, stormwater runoff from the roadway sheet flows offsite into roadside ditches and natural depressional areas. Runoff is generally conveyed through existing swales and cross drains, ultimately discharging toward natural drainage features located outside the project corridor. There are four existing ponds along the project due to the previous addition for the Georgia Pacific Access Road project under ERP # 44026106.001. According to the USDA NRCS Highlands County Soil Survey, predominant soil types in Basin 1203 include Satellite Sand [14], Basinger Fine Sand [12], and Myakka Fine Sand [10], classified as Hydrologic Soil Groups A and A/D. Estimated SHGWT

ranges from 0.0 to 1.5 feet below ground surface. Drainage maps are included under Appendix 6. The ICPR nodal diagram for Basin 1203 is provided in Appendix 1.

3.3.2 Post-Development Analysis

The proposed improvements along SR 70 within Basin 1203 include roadway widening and the addition of a shared use path. Stormwater runoff from the roadway will be collected and conveyed through storm drain systems and linear ponds to wet detention ponds, depending on the selected SMF alternative. The system will ensure proper treatment and attenuation before discharge to the outfall location. When determining the required treatment and attenuation volume, the volumes from the impacted ponds are included. The post-development design maintains the general drainage flow direction.

3.3.3 Alternative 1

Alternative 1 includes SMF 1203A, SMF 1203D, and SMF 1203E. Runoff collected in this sub-basin will be conveyed to a series of linear ponds (SMF 1203E) extending from Station 1223+10 to Station 1231+80 on the left side of the roadway. The area of SMF 1203E measures 0.55-acre. Following treatment from the linear ponds, runoff is conveyed to SMF 1203A, which is a 1.29-acre wet detention pond located on the left side of the roadway from Station 1211+79 to Station 1214+39. After treatment and attenuation at SMF 1203A, runoff is conveyed to SMF 1203D through a storm drain system. SMF 1203D is a 0.75-acre wet detention pond located from Station 1209+13 to Station 1211+14 on the left side of the roadway and is a remnant parcel due to the Old SR 8 realignment. No easement area is required. Following treatment and attenuation at SMF 1203D, runoff is discharged to the wetland north of these SMFs.

The estimated ground elevation at SMF 1203A is 112.0 feet. The proposed low edge of pavement (LEOP) within the subbasin is 116.7 feet. The SHGWT for SMF 1203A is 111.4 feet. SMF 1203A provides a treatment volume of 0.50 acre-feet and an attenuation volume of 2.38 acre-feet. The estimated ground elevation at SMF 1203D is 112.0 feet. The proposed LEOP within the subbasin is 114.95 feet. The SHGWT for SMF 1203D is 110.6 feet. SMF 1203D provides a treatment volume of 0.09 acre-feet and an attenuation volume of 1.18 acre-feet. SMF 1203E provides a treatment volume of 0.42 acre-feet. The previous presumptive treatment volume for all three ponds is 0.53 acre-feet, while 0.98 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume of all three ponds is 3.57 acre-feet, while 3.59 acre-feet is provided. To accommodate for hydraulic head, additional volume beyond the required attenuation volume is provided above the linear treatment cells. Nutrient removal rates provided by SMF 1203A, SMF 1203D, and SMF 1203E are 80% of Total Nitrogen (TN) and 93% of Total Phosphorus (TP).

The soil at SMF 1203A is Satellite Sand [14]. Hydrologic Soil Group is A. Land use consists of [2400] Nurseries and Vineyards, [4340] Upland Hardwood, and [6150] Stream and Lake Swamps. The soil at SMF 1203D is Satellite Sand [14]. Hydrologic Soil Group is A. Land use consists of [2400] Nurseries and Vineyards and [8100] Transportation. The soil at SMF 1203E is Daytona Sand [5] and Myakka Fine Sand

[10]. Hydrologic Soil Group is A and A/D. SMF 1203E lies within the proposed roadway right-of-way so there is no assigned land use.

Floodplain impacts and compensation costs are 0.66 acre-feet and $192,699, respectively, for the entire alternative. Estimated wetland impacts for are 1.73 acres with a mitigation cost of $173,000 for SMF 1203A, and 0.22 acres with a mitigation cost of $22,000 for SMF 1203D.

Recorded historical resources at this alternative are rated Low for SMF 1203A and High for SMF 1203D. The hazardous material risk rating is Medium for SMF 1203A and SMF 1203D. This alternative has a Medium potential to impact protected, threatened, or endangered species, with a species mitigation cost of $22,600 for SMF 1203A and $12,000 for SMF 1203D. SMF 1203A, SMF 1203D, and SMF 1203E are not located within a Section 4(f) resource area and there is no conservation mitigation cost.

For Alternative 1, SMF 1203E, all proposed linear ponds are located entirely within the proposed roadway right-of-way. As such, species mitigation, conservation mitigation, and wetland mitigation costs do not contribute to the total cost of the alternative, as these impacts are considered consistent throughout the proposed right-of-way of Basin 1203.

Major utilities including Florida Gas Transmission (FGT) gas pipeline and Florida Power and Light (FPL) transmission line are present, with potential impacts for each SMF. One parcel is impacted, requiring a whole take (WT). Total estimated cost is $2,291,471.

3.3.4 Alternative 2

Alternative 2 includes SMF 1203B, SMF 1203D, and SMF 1203F. Runoff collected in this sub-basin will be conveyed to a series of linear ponds (SMF 1203F) extending from Station 1214+40 to Station 1224+80 on the left and right side of the roadway. The area of SMF 1203F measures 1.08-acre. Following treatment from the linear ponds, runoff is conveyed to SMF 1203B, which is a 1.91-acre wet detention pond located on the right side of the roadway from Station 1214+46 to Station 1219+32. After treatment and attenuation at SMF 1203B, runoff is conveyed to SMF 1203D through a storm drain system. SMF 1203D is a 0.75-acre wet detention pond located from Station 1209+13 to Station 1211+14 on the left side of the roadway and is a remnant parcel due to the Old SR 8 realignment. No easement area is required. Following treatment and attenuation at SMF 1203D, runoff is discharged to the wetland north of these SMFs.

The estimated ground elevation at SMF 1203B is 112.0 feet. The proposed LEOP within the subbasin is 118.0 feet. The SHGWT for SMF 1203B is 113.3 feet. SMF 1203B provides a treatment volume of 0.59 acre-feet and an attenuation volume of 3.05 acre-feet. The estimated ground elevation at SMF 1203D is 112.0 feet. The proposed LEOP within the subbasin is 114.95 feet. The SHGWT for SMF 1203D is 110.6 feet. SMF 1203D provides a treatment volume of 0.09 acre-feet and an attenuation volume of 1.18 acre-feet. SMF 1203F provides a treatment volume of 0.47 acre-feet. The previous presumptive treatment volume for all three ponds is 0.53 acre-feet, while 1.15 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume of all three ponds is 4.05 acre-feet, while 4.23 acre-feet is provided. To accommodate for hydraulic head, additional volume beyond the required

attenuation volume is provided above the linear treatment cells. Nutrient removal rates provided by SMF 1203B, SMF 1203D, and SMF 1203F are 80% of Total Nitrogen (TN) and 92% of Total Phosphorus (TP).

The soil at SMF 1203B is Basinger Fine Sand [12] and Satellite Sand [14]. Hydrologic Soil Group is A and A/D. Land use consists of [4340] Upland Hardwood. The soil at SMF 1203D is Satellite Sand [14]. Hydrologic Soil Group is A. Land use consists of [2400] Nurseries and Vineyards and [8100] Transportation. The soil at SMF 1203F is Myakka Fine Sand [10], Basinger Fine Sand [12], and Satellite Sand [14]. Hydrologic Soil Group is A and A/D. SMF 1203F lies within the proposed roadway right-of-way so there is no assigned land use. Floodplain impacts and compensation costs are 0.55 acre-feet and $160,582, respectively, for the entire alternative. Estimated wetland impacts for this alternative are 0.79 acres with a mitigation cost of $79,168 for SMF 1203B, and 0.22 acres with a mitigation cost of $22,000 for SMF 1203D.

Recorded historical resources are rated Low for SMF 1203B and High for SMF 1203D. The hazardous material risk rating is Medium for SMF 1203B and SMF 1203D. This alternative has a Medium potential to impact protected, threatened, or endangered species, with a species mitigation cost of $36,300 for SMF 1203B and $12,000 for SMF 1203D. SMF 1203B, SMF 1203D, and SMF 1203F are not located within a Section 4(f) resource area and there is no conservation mitigation cost.

For Alternative 2, SMF 1203F, all proposed linear ponds are located entirely within the proposed roadway right-of-way. As such, species mitigation, conservation mitigation, and wetland mitigation costs do not contribute to the total cost of the alternative, as these impacts are considered consistent throughout the proposed right-of-way of Basin 1203.

Major utilities including Florida Gas Transmission (FGT) gas pipeline and Florida Power and Light (FPL) transmission line are present, with potential impacts for each SMF. One parcel is impacted requiring a partial take (P) for SMF 1203B and one parcel is impacted requiring a whole take (WT) for SMF 1203D. Total estimated cost is $2,863,120.

3.3.5 Alternative 3

Alternative 3 includes SMF 1203C, SMF 1203D, and SMF 1203G. Runoff collected in this sub-basin will be conveyed to a series of linear ponds (SMF 1203G) extending from Station 1216+40 to Station 1231+80 on the left side of the roadway. The area of SMF 1203G measures 0.95-acre. Following treatment from the linear ponds, runoff is conveyed to SMF 1203C, which is a 1.17-acre wet detention pond located on the left side of the roadway from Station 1214+95 to Station 1217+96. After treatment and attenuation at SMF 1203C, runoff is conveyed to SMF 1203D through a storm drain system. SMF 1203D is a 0.75-acre wet detention pond located from Station 1209+13 to Station 1211+14 on the left side of the roadway and is a remnant parcel due to the Old SR 8 realignment. No easement area is required. Following treatment and attenuation at SMF 1203D, runoff is discharged to the wetland north of these SMFs.

The estimated ground elevation at SMF 1203C is 112.0 feet. The proposed LEOP within the subbasin is 118.5 feet. The SHGWT for SMF 1203C is 112.6 feet. SMF 1203C provides a treatment volume of 0.47

acre-feet and an attenuation volume of 2.51 acre-feet. The estimated ground elevation at SMF 1203D is 112.0 feet. The proposed LEOP within the subbasin is 114.95 feet. The SHGWT for SMF 1203D of 110.6 feet. SMF 1203D provides a treatment volume of 0.09 acre-feet and an attenuation volume of 1.18 acre-feet. SMF 1203G provides a treatment volume of 0.63 acre-feet. The previous presumptive treatment volume for all three ponds is 0.53 acre-feet, while 1.09 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume of all three ponds is 3.62 acre-feet, while 3.79 acre-feet is provided. To accommodate for hydraulic head, additional volume beyond the required attenuation volume is provided above the linear treatment cells. Nutrient removal rates provided by SMF 1203C, SMF 1203D, and SMF 1203E are 80% of Total Nitrogen (TN) and 92% of Total Phosphorus (TP).

The soil at SMF 1203C is Myakka Fine Sand [10], Satellite Sand [14], and Hontoon Muck [21]. Hydrologic Soil Group is A and A/D. Land use consists of [2400] Nurseries and Vineyards and [4340] Upland Hardwood. The soil at SMF 1203D is Satellite Sand [14]. Hydrologic Soil Group is A. Land use consists of [2400] Nurseries and Vineyards and [8100] Transportation. The soil at SMF 1203G is Daytona Sand [5], Myakka Fine Sand [10], and Basinger Fine Sand [12]. Hydrologic Soil Group is A and A/D. SMF 1203G lies within the proposed roadway right-of-way so there is no assigned land use. Floodplain impacts and compensation costs are 1.15 acre-feet and $256,219, respectively, for the entire alternative.

Recorded historical resources are rated Low for SMF 1203C and High for SMF 1203D. The hazardous material risk rating is Medium for SMF 1203C and SMF 1203D. SMF 1203C and SMF 1203D have a Medium potential to impact protected, threatened, or endangered species, with a species mitigation cost of $27,000 for SMF 1203C and $12,000 for SMF 1203D. Estimated wetland impacts for are 1.69 acres with a mitigation cost of $169,000 for SMF 1203C, and 0.22 acres with a mitigation cost of $22,000 for SMF 1203D. SMF 1203C, SMF 1203D, and SMF 1203G are not located within a Section 4(f) resource area and there is no conservation mitigation cost.

For Alternative 3, SMF 1203G, all proposed linear ponds are located entirely within the proposed roadway right-of-way. As such, species mitigation, conservation mitigation, and wetland mitigation costs do not contribute to the total cost of the alternative, as these impacts are considered consistent throughout the proposed right-of-way of Basin 1203.

Major utilities including Florida Gas Transmission (FGT) gas pipeline and Florida Power and Light (FPL) transmission line are present, with potential impacts for each SMF. One parcel is impacted requiring a partial take (P) for SMF 1203C and one parcel is impacted requiring a whole take (WT) for SMF 1203D. Total estimated cost is $2,506,708.

3.3.6 Recommended SMF Site

SMF 1203A, SMF 1203D, and SMF 1203E

PROS

1. Least expensive alternative
2. Least expensive ROW cost
3. Least amount of species impacts

CONS

1. Most amount of wetland impacts
2. Requires deviation of FDOT criteria regarding base clearance

SMF 1203B, SMF 1203D, and SMF 1203F

PROS

1. Least amount of wetland impacts

CONS

1. Most expensive alternative
2. Most amount of species impacts
3. Requires deviation of FDOT criteria regarding base clearance

SMF 1203C, SMF 1203D, and SMF 1203G

PROS

1. Second least expensive alternative

CONS

1. Most amount of floodplain impacts
2. Requires deviation of FDOT criteria regarding base clearance

Recommendation

Based on an evaluation of total cost, construction cost, right-of-way cost, wetland impacts, and floodplain impacts, SMF 1203A, SMF 1203D, and SMF 1203E is the preferred alternative for Roadway Basin 1203.

Supporting documentation, including the completed SMF comparison table and cost estimates, can be found above and in Appendix 7.

3.4 Basin 1204

3.4.1 Pre-Development Analysis

Basin 1204 is a closed basin that extends from Station 1246+73.77 to Station 1266+51.97 along both the left and right sides of SR 70. Under existing conditions, stormwater runoff from the roadway sheet flows offsite into adjacent ditches and low-lying areas, eventually draining into downstream low-lying areas and natural drainage features within the project limits. There are two existing ponds along the project due to the previous addition SR 70/US 27 intersection improvement project under ERP # 4325519.001. According to the USDA NRCS Highlands County Soil Survey, predominant soils in Basin 1204 include Astatula Sand [9] and Paola Sand [1], both classified as Hydrologic Soil Group A, with estimated seasonal

high water table (SHGWT) greater than 6.67 feet. Drainage maps are included in Appendix 6. The ICPR nodal diagram for Basin 1204 is provided in Appendix 1.

3.4.2 Post-Development Analysis

The proposed improvements along SR 70 within Basin 1204 include roadway widening and the addition of a shared use path. Stormwater runoff from the improved roadway will be collected via a combination of roadside ditches and closed storm drain systems and conveyed to the selected SMF alternative for treatment and attenuation. When determining the required treatment and attenuation volume, the volumes from the impacted ponds are included. The post-development design will maintain existing drainage flow directions.

3.4.3 Alternative 1

SMF 1204A is a 1.60-acre dry retention pond located on the left side of the roadway from Station 1253+96 to Station 1256+67. Runoff will be conveyed to this SMF through roadside ditches and storm drain systems.

The estimated ground elevation at SMF 1204A is 131.0 feet, with a proposed LEOP of 133.1 feet and a SHGWT elevation of 119.6 feet. The previous presumptive treatment volume is 0.35 acre-feet, while 0.95 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume is 7.02 acre-feet, while 7.24 acre-feet is provided. Nutrient removal rates provided by SMF 1204A are 84% of Total Nitrogen (TN) and 84% of Total Phosphorus (TP).

The predominant soil at this location is Paola Sand [1], which is classified as Hydrologic Soil Group A. The land use in the SMF footprint is [2200] Tree Crops. Recorded historical resources at this location are rated Low. The hazardous material risk rating is Medium. This site has a High potential to impact protected, threatened, or endangered species, with a species mitigation cost of $24,000. No wetland or conservation land impacts are anticipated with this alternative.

There are no Section 4(f) areas located near the site. A Florida Power and Light (FPL) transmission line is present near the site, with potential impacts. One parcel is affected, requiring a partial take (P). Estimated floodplain impacts are 0.01 acres, with no floodplain compensation cost. Total cost is estimated to be $1,027,298.

3.4.4 Alternative 2

SMF 1204B is a 2.02-acre dry retention pond located on the left side of the roadway from Station 1261+59 to Station 1265+43. Runoff will be conveyed to this SMF through roadside ditches and storm drain systems.

The estimated ground elevation at SMF 1204B is 129.0 feet, with a proposed LEOP of 133.1 feet and a SHGWT elevation of 119.9 feet. The previous presumptive treatment volume is 0.38 acre-feet, while 1.24

acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume is 8.82 acre-feet, while 9.02 acre-feet is provided. Nutrient removal rates provided by SMF 1204B are 84% of Total Nitrogen (TN) and 84% of Total Phosphorus (TP).

The predominant soil at this location is Paola Sand [1], which is classified as Hydrologic Soil Group A. The land use in the SMF footprint is [2200] Tree Crops. Recorded historical resources at this location are rated Medium. The hazardous material risk rating is Medium. This site has a High potential to impact protected, threatened, or endangered species, with a species mitigation cost of $25,300. No wetland or conservation land impacts are anticipated with this alternative.

There are no Section 4(f) areas located near the site. A Florida Power and Light (FPL) transmission line is present near the site, with potential impacts. One parcel is affected, requiring a partial take (P). There are no floodplain impacts; therefore, no compensation cost is required. Total cost is estimated to be $1,440,753.

3.4.5 Alternative 3

SMF 1204C is a 2.25-acre dry retention pond located on the right side of the roadway from Station 1262+16 to Station 1265+50. Runoff will be conveyed to this SMF through roadside ditches and storm drain systems.

The estimated ground elevation at SMF 1204C is 130.0 feet, with a proposed LEOP of 133.1 feet and a SHGWT elevation of 121.8 feet. The previous presumptive treatment volume is 0.31 acre-feet, while 0.80 acre-feet is provided to meet the minimum required nutrient removal rates. The required attenuation volume is 10.25 acre-feet, while 10.57 acre-feet is provided. To meet the minimum required nutrient removal rates, the treatment volume provided exceeds the presumptive requirement. Nutrient removal rates provided by SMF 1204C are 80% of Total Nitrogen (TN) and 80% of Total Phosphorus (TP).

The predominant soil at this location is Paola Sand [1], which is classified as Hydrologic Soil Group A. The land use in the SMF footprint is [2200] Tree Crops. Recorded historical resources at this location are rated Low. The hazardous material risk rating is Medium. This site has a High potential to impact protected, threatened, or endangered species, with a species mitigation cost of $68,420. No wetland or conservation land impacts are anticipated with this alternative.

There are no Section 4(f) areas or major utilities located near the site. One parcel is affected, requiring a partial take (P). There are no floodplain impacts; therefore, no compensation cost is required. Total cost is estimated to be $1,861,809.

ESTIMATED CONSTRUCTION COST	$413,298	$795,453	$1,053,389
ROW COST ESTIMATE (INCLUDES EASEMENTS)	$590,000	$620,000	$740,000
TOTAL ESTIMATED COSTS	**$1,027,298**	**$1,440,753**	**$1,861,809**
RECOMMENDED SMF ALTERNATIVE	**SMF 1204A**		

Note:
The information presented in this table are subject to change until final Phase of the project.

3.4.6 Recommended SMF Site

SMF 1204A

PROS

1. Least expensive alternative
2. Least amount of species impacts

CONS

1. Small amount of floodplain impacts

SMF 1204B

PROS

1. Second least expensive alternative
2. No floodplain impacts

CONS

1. Medium historical structures ranking

SMF 1204C

PROS

1. No floodplain impacts
2. No utilities present

CONS

1. Most expensive alternative
2. Most amount of species impacts

Recommendation

Based on an evaluation of right-of-way impacts, total cost, floodplain impacts, species mitigation, and historical structures ranking, SMF 1204A is the preferred alternative for Roadway Basin 1204.

Supporting documentation, including the completed SMF comparison table and cost estimates, can be found above and in Appendix 7.

4 ALTERNATIVE FLOODPLAIN COMPENSATION (FPC) SITES

The 100-year floodplain areas were determined by the Lake Placid ICPR watershed model for most of the project and the SR 25 (US 27) at SR 70 Intersection Improvements ICPR report per SWFWMD Permit Number 43025519.001 at the tail end of the project. There are 67 sub-basins in the Lake Placid watershed model that are directly adjacent to SR 70. The proposed roadway improvements will impact the 100-year floodplain within 50 of the 67 sub-basins. There are four sub-basins with floodplains in the SR 25 (US 27) at SR 70 Intersection Improvements report that are directly adjacent to SR 70. The proposed roadway improvements will impact the 100-year floodplain within three of the four sub-basins.

Floodplain mitigation alternatives included in this report include an analysis based on the "cup for cup" compensation methodology. Storage was based on a comparison of the total volume filled within the 100-year floodplain versus the total volume excavated for floodplain compensation. During permitting of the project, the floodplain compensation volumes will be compared with the floodplain impact volumes in one-half foot elevation increments to demonstrate equivalent storage as required by the SWFWMD. Hydrologic and hydraulic modeling will be required where equivalent storage cannot be demonstrated in one-half foot increments.

Considered Alternatives

"Cup for Cup" Approach: Floodplain encroachment volumes from the proposed roadway section were estimated between the lowest level of encroachment (maximum of the average SHGWT elevation and lowest level of fill) and 100-year floodplain elevation for each sub-basin using the OpenRoads Designer three-dimensional computer-aided design software. Encroachment volumes were based on the topographical survey taken within the right-of-way. Impacts to a group of sub-basins which were hydraulically connected were compensated for within a single FPC alternative. This limited the required amount of FPC sites and allowed for the combination of those sites where impacts were minor. Up to two alternatives for FPC sites (except FPC 1214 with three alternatives) were evaluated and were sized based on estimated SHW elevations from geotechnical borings, surveyed high water marks (stain lines), and surface water gauges from the SWFWMD's hydrologic data collection stations.

Modeling: While no hydrologic and hydraulic modeling has been performed in this study, it is anticipated that modeling will be required during the permit phase of the project. Equivalent storage cannot be demonstrated at one-half foot increments for FPC sites where the SHGWT elevation is above the lowest level of encroachment by more than one-half foot. Therefore, modeling will be required on a case-by-case basis to demonstrate that floodplain impacts will not adversely affect the storage stages during the 100-year and all lesser flood events.

Furthermore, some runoff volume from the impacted areas will be redirected from the floodplains to the stormwater management facilities. The existing runoff from the floodplain is being bypassed to the proposed pond. This will result in a reduction of the floodplain impact caused by the roadway fill. Therefore, modeling will be utilized to demonstrate no impacts or reduced impacts are associated with the proposed roadway improvements. Updates and modifications to the existing Lake Placid ICPR watershed model and incorporation of the SR 25 (US 27) at SR 70 Intersection Improvements ICPR will be performed in the permitting phase to refine, reduce, or eliminate FPC sites. A preliminary comparison of the redirected runoff volume and the encroachment volume has been performed, see Appendix 4.

Flood Rights: The Lake Wales Ridge Wildlife and Environmental Area is a conservation land that extends along the northern side of SR 70 between the beginning of the project near Placid View Drive to just west of Nursery Lane. An option to acquire temporary flooding easements and obtain flood rights was investigated to avoid disturbing the natural state of the conservation land with an FPC site and instead allow temporary increases of flood stages on land that already floods during the 100-year storm event. The investigation included a preliminary evaluation of the increased flood area for five separate floodplains along the conservation land. The new floodplain footprint was developed by stacking the floodplain encroachment volume on top of the existing floodplain area. However, the five floodplains are part of an open basin, and it is recommended that modeling be performed prior to negotiations with the property owner to demonstrate no adverse impacts downstream of the floodplain. The preliminary evaluation and calculations for each of the five floodplains is included in Appendix 4.

Table 4-1 Floodplain Impact Summary

Floodplain Name	ICPR Sub-basin Name	Model/ Permit Source	Floodplain Location (CL Construction)		100-year Floodplain Elevation (ft, NAVD)	Impact Volume (ac-ft)	Preferred Floodplain Compensation Site
			From Station	To Station

4.1 FPC 1201

Floodplain 1201 includes ICPR watershed model sub-basin BLP0005. The roadway corridor will encroach upon the 100-year floodplain within sub-basin BLP0005 and is located on conservation land. The 100-year stage of sub-basin BLP0005 is 140.03 feet and will impact 1.77 acre-feet of floodplain. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.1.1 Alternative 1

FPC 1201A is an offsite floodplain compensation site located in a pasture southeast of the SR 70 and South Jefferson Avenue intersection. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. There are significant floodplains to the south of SR 70 which are isolated from Floodplain 1201 by SR 70 (no existing cross drain). The site is constrained by the adjacent floodplain to the south and east, the FGT line to the north, and South Jefferson Avenue to the west. To avoid impacts to the conservation land and adjacent floodplain, only one alternative FPC site was evaluated.

The site can be accessed via the right-of-way along South Jefferson Avenue. There is also an existing 55-foot-wide easement along the south side of SR 70 which abuts the proposed right-of-way for FPC 1201A. The existing easement appears to be designated for the existing utilities and a determination will be required to whether this will allow access to the FPC site. For this study, it was assumed that a new drainage access easement would be required to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 138.8 feet. Installation of pond liner is proposed to increase the capacity of the compensation volume by lowering the FPC site bottom elevation to 137.8 feet which is below the SHGWT elevation. The site provides 1.77 acre-feet of floodplain compensation. A 15-foot berm will encompass the site to provide one foot of freeboard and avoid backflow to adjacent properties. A piped connection from the FPC site to Floodplain 1201 will be required and will require crossing the buried FGT line and SR 70. See Table 4-2 for a summary of the FPC site information.

4.1.2 Alternative 2

Alternative 2 evaluated the option to obtain flood rights. Without providing mitigation for the floodplain impacts, the footprint of Floodplain 1201 is estimated to increase by 1.06 acres. Sub-basin BLP0005 is an open basin which outfalls to the north, and it is recommended that modeling be performed prior to negotiations with the property owner to demonstrate no adverse impacts downstream of the floodplain. The calculations for the estimated increased floodplain area footprint are included in Appendix 4.

Table 4-2 FPC 1201 Alternatives

BASIN CONDITION: ONE FPC IS REQUIRED	**Floodplain 1201**
	Alternative1 FPC 1201A

Recommended FPC Alternative	Alternative 2: Flood Rights

[1] Liner proposed to lower FPC bottom elevation below SHW elevation to 137.8 feet

4.1.3 Recommended FPC Site

FPC 1201A

PROS

1. No wetland or conservation impacts
2. Low archaeological potential
3. Low risk for hazardous material

CONS

1. High impact on T/E species
2. Potential major utilities impacted
3. Piping, Liner, and maintenance costs

Recommendation

FPC 1201A was the only FPC alternative evaluated. Because of the elevated risks of encountering and mitigating protected, threatened, and endangered species, potential impacts to the major utilities including the FGT gas pipeline, and higher costs associated with the piping and liner, it is recommended that flood rights and modeling be further investigated as a feasible alternative.

4.2 FPC 1203

Floodplain 1203 includes ICPR watershed model sub-basins BLP0001, BLP0031, BLP0037, and BLP0063. The roadway corridor will encroach upon the 100-year floodplain within these sub-basins and impact 0.66 acre-feet of floodplain. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.2.1 Alternative 1

FPC 1203A is an offsite floodplain compensation site located in a pasture south of the SR 70 and east of Park Land Drive. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. The FPC is located approximately 400 feet south of SR 70 and a drainage access easement will be required for this site.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 139.1 feet. The site provides 0.80 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLP0037. See Table 4-3 for a summary of the FPC site information.

4.2.2 Alternative 2

FPC 1203B is an offsite floodplain compensation site located in a pasture south of the SR 70 and east of Park Land Drive along a private driveway. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. The FPC is located approximately 440 feet south of SR 70 and a drainage access easement will be required for this site.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 139.1 feet. The site provides 0.86 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLP0037. See Table 4-3 for a summary of the FPC site information.

4.2.3 Alternative 3

Alternative 3 evaluated the option to obtain flood rights. Without providing mitigation for the floodplain impacts, the footprint of Floodplain 1203 is estimated to increase by 3.74 acres. This includes floodplain encroachment in sub-basin BLP0054 which was not considered in either FPC alternatives. Sub-basin BLP0005 is an open basin that outfalls to the north, and it is recommended that modeling be performed prior to negotiations with the property owner to demonstrate no adverse impacts downstream of the floodplain. The calculations for the estimated increased floodplain area footprint are included in Appendix 4.

TOTAL ESTIMATED COSTS	**$366,695**	**$290,900**
Recommended FPC Alternative	Alternative 3: Flood Rights	

4.2.4 Recommended FPC Site

FPC 1203A

PROS	CONS
1. Site abuts property line	1. Higher wetland or conservation impacts
2. Lower right-of-way cost	2. Higher T/E species impacts
3. Lower construction cost	

FPC 1203B

PROS	CONS
1. Lower wetland or conservation impacts	1. Site in middle of property
2. Lower T/E species impacts	2. Higher right-of-way cost
3. Lower total estimated cost	3. Higher construction cost

Because of the elevated risks of encountering and mitigating protected, threatened, and endangered species, regulatory complexity, and costs associated with construction, maintenance, mitigation, and rights-of-way, it is recommended that Alternative 3: flood rights as the preferred alternative.

4.3 FPC 1205

Floodplain 1205 includes ICPR watershed model sub-basins BLP0002 and BLP0505. The roadway corridor will encroach upon the 100-year floodplain within these sub-basins and impact 0.51 acre-feet of floodplain. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.3.1 Alternative 1

FPC 1205A is an offsite floodplain compensation site located in a forested wetland southwest of the SR 70 and Placid View Drive intersection directly adjacent to the existing utility easement. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. For this study, it was assumed that a new drainage access easement would be required across the 55-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 135.1 feet. The site provides 0.59 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLP0505. The elevation of the top of the FPC site was based on the peak stage recorded at the south (upstream) end of the cross drain under SR 70 from SWFWMD's surface water gauge at Station No. 716776. See Table 4-4 for a summary of the FPC site information.

4.3.2 Alternative 2

FPC 1205B is an offsite floodplain compensation site located on the opposite channel bank from FPC 1205A in a pasture southwest of the SR 70 and Placid View Drive intersection directly adjacent to the existing utility easement. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. For this study, it was assumed that a new drainage access easement would be required across the 55-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 135.1 feet. The site provides 0.56 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLP0505. The elevation of the top of the FPC site was based on the peak stage recorded at the south (upstream) end of the cross drain under SR 70 from SWFWMD's surface water gauge at Station No. 716776. See Table 4-4 for a summary of the FPC site information.

4.3.3 Alternative 3

Alternative 3 evaluated the option to obtain flood rights. Without providing mitigation for the floodplain impacts, the footprint of Floodplain 1205 is estimated to increase by 0.18 acres. Sub-basin BLP0002 is an open basin which outfalls to the north, and it is recommended that modeling be performed prior to negotiations with the property owner to demonstrate no adverse impacts downstream of the floodplain. The calculations for the estimated increased floodplain area footprint are included in Appendix 4.

Table 4-4 FPC 1205 Alternatives

BASIN CONDITION: ONE FPC IS REQUIRED	Floodplain 1205

Recommended FPC Alternative	Alternative 3: Flood Rights	

4.3.4 Recommended FPC Site

FPC 1205A

PROS

1. Low archaeological potential
2. Lower right-of-way cost

CONS

1. Higher construction cost
2. Higher T/E species impacts
3. Higher wetland or conservation impacts

FPC 1205B

PROS	CONS
1. Lower T/E species impacts	1. Medium archaeological potential
2. Lower construction cost	2. Higher right-of-way cost
3. Lower wetland or conservation impacts	

Because of the elevated risks of encountering and mitigating protected, threatened, and endangered species, regulatory complexity, and costs associated with construction, maintenance, mitigation, and rights-of-way, it is recommended that Alternative 3: flood rights as the preferred alternative.

4.4 FPC 1206

Floodplain 1206 includes ICPR watershed model sub-basins BLP0004 and BLP0477. The roadway corridor will encroach upon the 100-year floodplain within these sub-basins and impact 0.42 acre-feet of floodplain. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.4.1 Alternative 1

FPC 1206A is an offsite floodplain compensation site located in a rural residential land southeast of the SR 70 and Placid View Drive intersection directly adjacent to the existing utility easement. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. For this study, it was assumed that a new drainage access easement would be required across the 55-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 133.8 feet. The elevation of the bottom of the FPC site was based on the historical stage recorded at the south (upstream) end of the cross drain under SR 70 from SWFWMD's surface water gauge at Station No. 716778. The peak stage has only exceeded elevation 132.5 three times in the last ten years and the FPC will be directly connected to the floodplain near the upstream end of the cross drain. The site provides 0.55 acre-feet of floodplain compensation. See Table 4-5 for a summary of the FPC site information.

4.4.2 Alternative 2

FPC 1206B is an offsite floodplain compensation site located on the opposite channel bank from FPC 1206A in a rural residential land southeast of the SR 70 and Placid View Drive intersection directly adjacent to the existing utility easement. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. For this study, it was assumed that a new drainage access easement would be required across the 55-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 133.8 feet. The elevation of the bottom of the FPC site was based on the historical stage recorded at the south (upstream)

end of the cross drain under SR 70 from SWFWMD's surface water gauge at Station No. 716778. The peak stage has only exceeded elevation 132.5 feet three times in the last ten years and the FPC will be directly connected to the floodplain near the upstream end of the cross drain. Therefore, the estimated SHGWT at the upstream end of the cross drain was used in lieu of the site-specific data provided by Tierra, Inc. The site provides 0.49 acre-feet of floodplain compensation. See Table 4-5 for a summary of the FPC site information.

4.4.3 Alternative 3

Alternative 3 evaluated the option to obtain flood rights. Without providing mitigation for the floodplain impacts, the footprint of Floodplain 1206 is estimated to increase by 0.10 acres. Sub-basin BLP0477 is an open basin which outfalls to the north, and it is recommended that modeling be performed prior to negotiations with the property owner to demonstrate no adverse impacts downstream of the floodplain. The calculations for the estimated increased floodplain area footprint are included in Appendix 4.

Recommended FPC Alternative	Alternative 3: Flood Rights	

4.4.4 Recommended FPC Site

FPC 1206A

PROS

1. Low archaeological potential
2. Lower construction cost
3. Lower right-of-way cost

CONS

1. Higher wetland or conservation impact

FPC 1206B

PROS	CONS
1. Lower wetland or conservation impacts	1. Higher right-of-way cost 2. Higher construction cost 3. Medium archaeological potential

Because of the elevated risks of encountering and mitigating protected, threatened, and endangered species, regulatory complexity, and costs associated with construction, maintenance, mitigation, and rights-of-way, it is recommended that Alternative 3: flood rights as the preferred alternative.

4.5 FPC 1208

Floodplain 1208 includes ICPR watershed model sub-basins BLP0030, BLP0066, BLP0078, BLP0376, and BLP0394. The roadway corridor will encroach upon the 100-year floodplain within these sub-basins and impact 1.06 acre-feet of floodplain. Additionally, the maximum floodplain encroachment volume by the proposed SMF 1201 alternatives is 0.21 acre-feet for a total impact of 1.27 acre-feet. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.5.1 Alternative 1

FPC 1208A is an offsite floodplain compensation site located in citrus groves south of the SR 70 and west of the Lake Wales Ridge Ecosystem conservation land directly adjacent to the existing utility easement. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. For this study, it was assumed that a new drainage access easement would be required across the 55-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 114.0 feet. The SHGWT biological indicator (stain line) on the headwall at the south end (upstream) of the cross drain under SR 70 located east of the FPC site was surveyed at elevation 112.3 feet. The elevation of the bottom of the FPC site is 113.15 and was based on the average SHGWT elevation of the site-specific data and the surveyed biological indicator. A 15-foot berm will encompass the site to provide one foot of freeboard and avoid backflow to adjacent properties. A piped connection from the FPC site to Floodplain 1208 will be required and will require crossing the buried FGT line. The site provides 1.39 acre-feet of floodplain compensation. See Table 4-6 for a summary of the FPC site information.

4.5.2 Alternative 2

FPC 1208B is an offsite floodplain compensation site located in tree crops south of the SR 70 and east of the Lake Wales Ridge Ecosystem conservation land directly adjacent to the existing utility easement. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is

a conservation land. For this study, it was assumed that a new drainage access easement would be required across the 55-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the average SHGWT to be at elevation 113.65 feet. The SHGWT biological indicator (stain line) on the headwall at the south end (upstream) of the cross drain under SR 70 located east of the FPC site was surveyed at elevation 112.3 feet. The elevation of the bottom of the FPC site is 112.98 feet and was based on the average SHGWT elevation of the site-specific data and the surveyed biological indicator. A 15-foot berm will encompass the site to provide one foot of freeboard and avoid backflow to adjacent properties. A piped connection from the FPC site to Floodplain 1208 will be required and will require crossing the buried FGT line. FPC 1208B will encroach upon the 100-year floodplain within sub-basin BLP0376 and impact 0.10 acre-feet of floodplain for a total floodplain impact of 1.37 acre-feet. The site provides 1.45 acre-feet of floodplain compensation. See Table 4-6 for a summary of the FPC site information.

4.5.3 Alternative 3

Alternative 3 evaluated the option to obtain flood rights. Without providing mitigation for the floodplain impacts, the footprint of Floodplain 1208 is estimated to increase by 0.04 acres. Sub-basin BLP0066 and further downstream Sub-basin BLP0380 are open basins that outfall to the north, and it is recommended that modeling be performed prior to negotiations with the property owner to demonstrate no adverse impacts downstream of the floodplain. The calculations for the estimated increased floodplain area footprint are included in Appendix 4.

Recommended FPC Alternative	Alternative 3: Flood Rights	

4.5.4 Recommended FPC Site

FPC 1208A

PROS

1. No wetland or conservation impacts

CONS

1. Higher T/E species impacts
2. Higher right-of-way cost
3. Higher construction cost

FPC 1208B

PROS	CONS
1. No wetland or conservation impacts	1. Potential utilities impacted
2. Lower T/E species impacts	
3. Low archaeological potential	
4. Lower construction cost	
5. Lower right-of-way cost	

Because of the elevated risks of encountering and mitigating protected, threatened, and endangered species, potential impacts to the major utilities, including the FGT gas pipeline, and higher costs associated with the piping and liner, regulatory complexity, and costs associated with construction, maintenance, mitigation, and rights-of-way, it is recommended that Alternative 3: flood rights as the preferred alternative.

4.6 FPC 1211

Floodplain 1211 includes ICPR watershed model sub-basins BLA0030, BLA0334, BLA0336, and BLA0341. The roadway corridor will encroach upon the 100-year floodplain within these sub-basins and impact 0.90 acre-feet of floodplain. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.6.1 Alternative 1

FPC 1211A is an offsite floodplain compensation site located in tree crops southwest of the SR 70 and Nursery Lane intersection directly adjacent to the existing utility easement. The property to the north of SR 70 is part of the Lake Wales Ridge Wildlife and Environmental Area which is a conservation land. For this study, it was assumed that a new drainage access easement would be required across the 50-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The estimated SHWL of 12.57 feet was derived from the average of three site-specific boring data provided by Tierra, Inc., in conjunction with the downstream floodplain SHGWT. A berm will not be required since the top elevation of the FPC site is lower than the surrounding terrain. A piped connection from the FPC site to Floodplain 1211 will be required and will require crossing the buried FGT line. The site provides 1.08 acre-feet of floodplain compensation. See Table 4-7 for a summary of the FPC site information.

4.6.2 Alternative 2

FPC 1211B is an offsite floodplain compensation site located in a low-density residential lot northeast of the SR 70 and Nursery Lane intersection directly adjacent to the existing utility easement. For this study,

it was assumed that a new drainage access easement would be required across the 50-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 110.2 feet. A berm will not be required since the top elevation of the FPC site is lower than the surrounding terrain. A piped connection from the FPC site to Floodplain 1211 will be required and will require crossing the buried FGT line and SR 70. The site provides 1.23 acre-feet of floodplain compensation. See Table 4-7 for a summary of the FPC site information.

4.6.3 Recommended FPC Site

FPC 1211A

PROS	CONS
1. No wetland or conservation impacts	1. Higher T/E species impacts 2. Higher right-of-way cost 3. Higher construction cost

FPC 1211B

PROS	CONS
1. No wetland or conservation impacts 2. Lower T/E species impacts 3. Low archaeological potential 4. Lower construction cost 5. Lower right-of-way cost	1. Potential utilities impacted

Based on an evaluation of right-of-way impacts, construction cost, wetland impacts, conservation land impacts, species mitigation, and FPC area, FPC 1211B is the preferred alternative.

This alternative was selected due to the lowest species mitigation cost, low archaeological potential, and lowest construction cost. The cost estimates can be found above and in Appendix 7.

4.7 FPC 1213

Floodplain 1213 includes ICPR watershed model sub-basins BLA0261, BLA0356, BLA0360, BLA0361, BLP0411, and BLP0509. The roadway corridor will encroach upon the 100-year floodplain within these sub-basins and impact 1.07 acre-feet of floodplain. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.7.1 Alternative 1

FPC 1213A is an offsite floodplain compensation site located in tree crops northwest of the SR 70 and Old State Road 8 intersection directly adjacent to the existing utility easement. For this study, it was assumed that a new drainage access easement would be required across the 50-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 109.8 feet. The site provides 1.08 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLP0405. See Table 4-8 for a summary of the FPC site information.

4.7.2 Alternative 2

FPC 1213B is an offsite floodplain compensation site located in a stream and lake swamp northwest of the SR 70 and Old State Road 8 intersection directly adjacent to the existing utility easement. For this study, it was assumed that a new drainage access easement would be required across the 50-foot-wide existing utility easement to connect to the SR 70 FDOT right-of-way.

The site-specific data provided by Tierra, Inc. estimates the SHGWT to be at elevation 110.1 feet. The site provides 1.08 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLP0411. See Table 4-8 for a summary of the FPC site information.

Recommended FPC Alternative	FPC 1213A	

4.7.3 Recommended FPC Site

FPC 1213A

PROS	CONS
1. Lower construction cost	1. Medium risk for hazardous material
2. Lower wetland or conservation impacts	2. Higher right-of-way cost
	3. Higher T/E species impacts

FPC 1213B

PROS	CONS
1. Lower T/E species impacts	1. Higher construction cost
2. Low risk for hazardous material	2. Higher wetland or conservation impacts
3. Lower right-of-way cost	

Based on an evaluation of right-of-way impacts, construction cost, wetland impacts, conservation land impacts, species mitigation, and FPC area, FPC 1213A is the preferred alternative.

This alternative was selected due to the lowest wetland and conservation impact and lowest construction cost. The cost estimates can be found above and in Appendix 7.

4.8 FPC 1214

Floodplain 1214 includes ICPR watershed model sub-basins BLA0204, BLA0219, BLA0249, BLA0250, BLA0347, BLA0355, BLA0371, BLA0372, BLA0373, BLA0374, BLP0085, BLP0413, BLP0517, and BLP0518. The roadway corridor will encroach upon the 100-year floodplain within these sub-basins and impact 3.41 acre-feet of floodplain. Additionally, the floodplain encroachment volumes by the proposed SMF 1203 alternatives are 1.36 acre-feet for a total impact of 4.77 acre-feet. Refer to the floodplain calculations in Appendix 4 and the floodplain map in Appendix 6.

4.8.1 Alternative 1

Alternative 1 is a combination of three different sites: FPC 1214A, 1214C, and 1214D.

FPC 1214A is an offsite floodplain compensation site located in a coniferous mix of upland hardwood forest northwest of the SR 70 and Distribution Blvd. intersection setback approximately one quarter of a mile from the SR 70 right-of-way. The average of two different site-specific borings data provided by Tierra, Inc. estimates the SHGWT to be at elevation 112.73 feet. The site provides 1.65 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basins BLP0370 and BLP0415.

FPC 1214C is an offsite floodplain compensation site located in a coniferous mix of upland hardwood forest southwest of the SR 70 and Distribution Blvd. setback approximately 330 feet from the SR 70 right-of-way. The average of the site-specific borings data and the boring south of SR 70 within the right-of-way provided by Tierra, Inc. estimates the SHGWT to be at elevation 114.40 feet. The site provides 3.31 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLA0227.

FPC 1214D is an offsite floodplain compensation site located in a coniferous mix of upland hardwood forest northwest of the SR 70 and Distribution Blvd. intersection directly adjacent to the existing SR 70 right-of-way. The average of six site-specific borings data provided by Tierra, Inc. estimates the SHGWT to be at elevation 114.6 feet. The site provides 2.06 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basins BLP0087 and BLP0517.

FPC124A, 1214C, and 1214D provide a total of 7.01 acre-feet of floodplain compensation See Table 4-9 for a summary of the FPC site information.

4.8.2 Alternative 2

Alternative 2 is a combination of three different sites: FPC 1214B, 1214C, and 1214D.

FPC 1214B is an offsite floodplain compensation site located in a low-density residential land northwest of the SR 70 and Distribution Blvd. intersection setback approximately 275 feet from the SR 70 right-of-way. The average of two site-specific borings data provided by Tierra, Inc. estimates the SHGWT to be at an elevation of 113.05 feet. The site provides 1.25 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basin BLP0413.

Refer to section 4.8.1, Alternative 1, for information regarding FPC 1214C and FPC 1214D.

FPC124B, 1214C, and 1214D provide a total of 6.62 acre-feet of floodplain compensation. See Table 4-9 for a summary of the FPC site information.

4.8.3 Alternative 3

FPC 1214E is an offsite floodplain compensation site located in a coniferous mix of upland hardwood forest and freshwater marshes southwest of the SR 70 and Distribution Blvd. setback approximately 330 feet from the SR 70 right-of-way. The average of the site-specific borings data and the boring south of SR 70 within the right-of-way provided by Tierra, Inc. estimates the SHGWT to be at an elevation of 113.93 feet. The site provides 7.10 acre-feet of floodplain compensation and will be constructed to connect directly with the floodplain in sub-basins BLA0204, BLA0218, BLA0227, BLA0370, BLA0373, and BLA0374.

Recommended FPC Alternative	FPC 1214B, FPC 1214C, and FPC 1214D (Alternative 2)						

4.8.4 Recommended FPC Site

As FPC 1214C and FPC 1214D are present in both Alternatives 1 and 2, the analysis focused solely on comparing FPC 1214A and FPC 1214B. Furthermore, Alternative 3 (FPC 1214E) was incorporated to facilitate a comprehensive comparison among all three alternatives.

FPC 1214A

PROS

1. Low hazardous material risk

CONS

1. Highest T/E species impacts
2. Higher wetland or conservation impacts than FPC 1214B
3. Higher construction costs than FPC 1214B
4. Higher right-of-way cost than FPC 1214B

FPC 1214B

PROS

1. Low hazardous material risk
2. Lower T/E species impacts than FPC 1214A
3. Lowest wetland or conservation impacts
4. Lowest construction costs
5. Lowest right-of-way cost

CONS

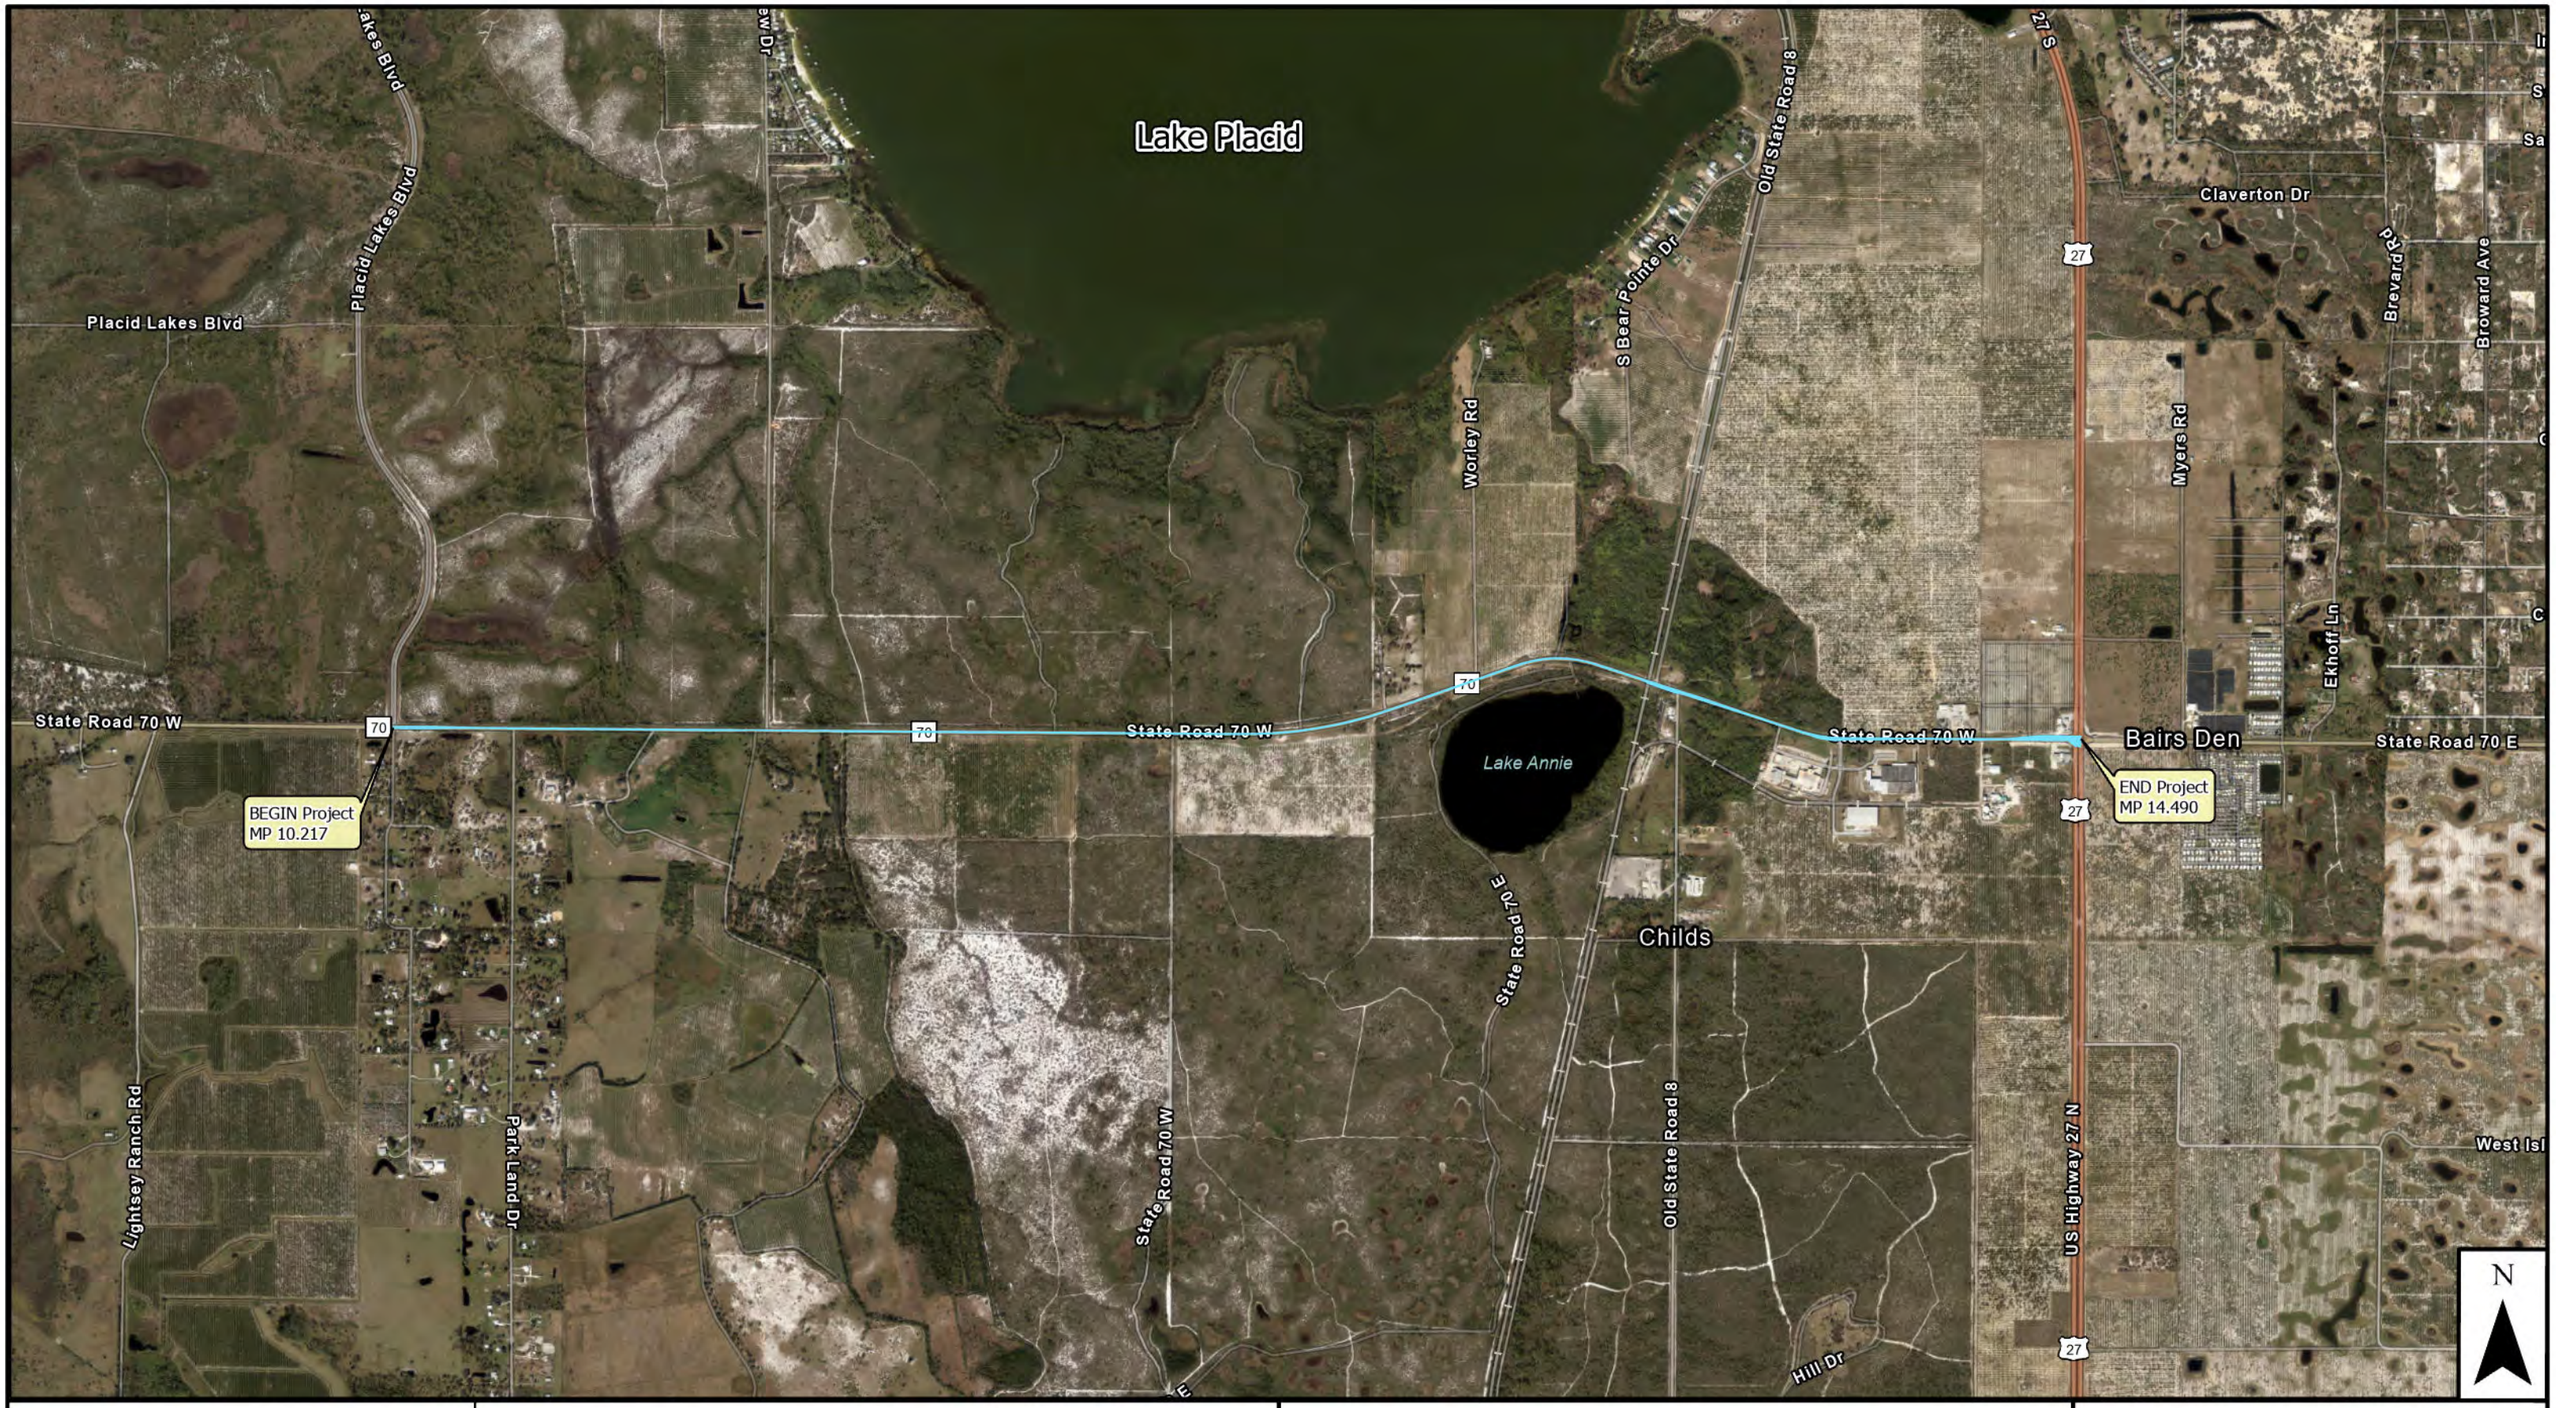
1. Higher T/E species mitigation cost
2. Maximum parcel required

FPC 1214E

PROS

1. Low hazardous material risk
2. Lower T/E species impacts

CONS



1. Highest wetland or conservation impacts
2. Highest right-of-way cost
3. Maximum parcel required

Based on an evaluation of right-of-way impacts, construction cost, wetland impacts, conservation land impacts, species mitigation, and FPC area, FPC 1214B is the preferred site. Therefore, alternative 2 combination of FPC 1214B, FPC 1214C, and FPC 1214D sites are the preferred alternative.

This alternative was selected due to the lowest wetland and conservation impact and the lowest construction cost. The cost estimates can be found above and in Appendix 7.

CORRESPONDENCE

Purpose of Meeting:
SR 70 Segments 12-13 – Jefferson Avenue to CR 29 (414506-3 & 414506-4)
Highlands County
SWFWMD Pre-Application Meeting

Date of Meeting
May 2, 2024, 2:00pm – 4:00pm

Location:
Microsoft Teams

Attendees:

- FDOT – Brent Setchell, Melody Joyner, Nicole Monies (Melanie Calvo, Atkins for OEM)
- SWFWMD – Al Gagne, Chris Kuzlo
- PGA – Joe Lauk
- HNTB – Matt Dockins, Hong (Sam) Chiu, Gordon Mullen, James Fine, John Burton, John Fowler, Bill Jones

Attachment: See presentation slides attached.

Agenda & Notes

1. Introductions
2. Overview
    a. Strategic Corridors – State Road (SR) 70
        i. Segments 12 and 13 (FPIDs 414506-3 and 414506-4)
        ii. Matt introduced the FDOT's Strategic Corridors program along SR 70 and the purpose and need for the proposed network improvements. Then specific discussion was provided relative to Segments 12 (from Jefferson Avenue east to US 27) and 13 (from US 27 east to County Road 29).
        iii. Sam introduced the three proposed roadway typical sections along the corridor.
3. SWFWMD/SFWMD Interagency Agreement
    a. The project limits crossing the SWFWMD/SFWMD boundaries in two locations, one west of US 27 and one east of US 27.
    b. The Interagency Agreement executed March 24, 2018 delegated the permitting authority for the entire limits of this project to the SWFWMD.
4. Stormwater Management
    a. Water Quality
        i. Sam referenced the prior December 2014 pre-application meeting and provided additional discussion for how the proposed improvements will address the nutrient impaired water bodies by demonstrating net improvement and meet SWFWMD's 150% of presumptive treatment volume for direct discharge to the Placid Lakes Outstanding Florida Water (OFW).
        ii. The Project Development and Environment (PD&E) study is expected to be complete approximately Summer of 2025 and therefore, should fall under the current stormwater rules.
    b. Water Quantity
        i. Sam provided additional discussion that the proposed improvements will address both peak discharge rates (in open basins) and discharge volumes (in closed basins).
    c. Floodplains

i. Part of the project is located within the Lake Placid watershed model. The project will use this watershed model as the best available information. Further evaluation may be necessary to model initial stages and the project specific seasonal high water.
ii. In the area without the watershed model, the Federal Emergency Management Agency (FEMA) map will be reviewed in conjunction with other data sources. The FDOT/Consultant will determine the appropriate 100-Year Base Flood Elevations and compensate for any impacts. Cup-for-cup compensation is the anticipated approach for those areas.

d. SWFWMD did not object to the proposed design criteria and approach discussed.

5. Utility and Environmental Considerations
   a. Utilities
      i. The project is sandwiched between a Florida Power & Light (FP&L) transmission line to the north and Florida Gas Transmission (FGT) pipeline to the south. Both are immediately adjacent to the SR 70 right-of-way and are costly to impact/relocate.
      ii. FP&L is currently in the process of relocating further to the north and enhancing their facilities.
      iii. FDOT is continuing coordination with both entities.
   b. Conservation Lands
      i. Much of the western project portion within Segment 12 is bounded by the Lake Wales Ridge Wildlife and Environmental Area (LWRWEA) and Archbold Biological Station.
      ii. The roadway improvements are evaluating widening to the north, which would impact the LWRWEA. FDOT is coordinating further with the Florida Fish and Wildlife Conservation Commission, Florida Department of Environmental Protection, and applicable state land agencies.
   c. Protected Species
      i. Numerous federal and state listed/protected species are or may be present in the project vicinity. Field surveys are on-going.
      ii. Brent discussed the location/siting rationale for the three proposed wildlife crossings.
      iii. Brent suggested that potential additional land acquisition(s) may be needed specifically for listed/protection species mitigation.
   d. Wetlands
      i. Based on preliminary impact analysis, approximately 18.5 acres of direct and secondary wetland impacts at approximately 8.8 UMAM functional loss units are anticipated for Segment 12.
      ii. Approximately 12.3 acres of direct and secondary wetland impacts at approximately 5.4 UMAM functional loss units are anticipated for Segment 13.
      iii. These impacts have not been field-reviewed with SWFMWD or US Army Corps of Engineers staff and are subject to change.
      iv. Mitigation options are limited within the three watershed basins. Only state credits are available within the Kissimmee Ridge (SWFWMD) and South Kissimmee (SFWMD) basins. State credits are not currently available within the Fisheating Creek basin. SWFWMD will accept state mitigation bank credits.
      v. No federal 404 credits are available in any of the three basins. FDOT expects that the existing banks will not be able to obtain federal credits by the time Segments 12 and 13 may need them prior to construction.
   e. Impacts & Mitigation Approaches
      i. Due to the location and environmentally sensitive nature of the project limits, FDOT is evaluating a variety of potential options.
         1. On-site mitigation is not initially desirable for FDOT, and there are limited options for this within the SR 70 corridor.

2. FDOT is considering a partnering option with a third-party company (i.e., permittee-responsible offsite mitigation within the same basin. This may require 2 separate permits (one for the proposed improvements and one for the mitigation) and could potentially be linked as permit conditions. FDOT would be a co-permittee and have an MOU with a third-party contractor with specific conditions directed to the third-party contractor, who would be responsible for the construction, perpetual operations and maintenance of the mitigation site. FDOT would not want to do annual payments but would prefer to do a lump-sum payment for the third-party to put in escrow.
    a. SWFWMD has recently received direction from FDEP. SWFWMD views this as being comparable to developer permits with excess functional gain in which they modify the excess functional gain permit for each phase of development. FDEP doesn't like this approach. Going forward, off-site mitigation permits will need to specifically identify to which project(s) the excess functional gain applies (i.e., like a bank ledger). SWFWMD has no issues with FDOT doing offsite mitigation, but they urged cautioned for who will be the permittee.
3. Brent discussed a potential option which could include land acquisition, livestock removal and potentially hydrologic improvements to be completed on large portion of acreage adjacent to the Platt Branch Wildlife and Environmental Area (FDOT's Platt Branch species mitigation bank) and US 27. FDOT could acquire the existing gap between both areas, remove cattle to gain functional lift to local wetlands and water quality, and add a second wildlife crossing at US 27. FDOT understands that sufficient functional lift may exist due to the large amount of acreage involved. The mitigation for several segments of the SR 70 could likely be tied to this mitigation site.
    a. SWFWMD noted that this site would be within the Fisheating Creek watershed (within the SFWMD's boundaries). SWFWMD would allow this, but the FDOT would have to address the functional loss within the impacted Kissimmee Ridge basin, and potential cumulative impacts. SWFWMD may require a 1:1 (acreage) mitigation within the same basin (while other functional gain could occur out of basin). SWFWMD stated that FDOT may need to propose multiple different strategies to avoid cumulative impacts.
    b. SWFWMD asked whether FDOT has had to address the USACE proximity (multiplication) factor for mitigation based on distance from the impacted hydrologic use code (HUC) basin (multiplier based on the # of basins away from subject basin). Brent indicated that District One's prior experience with this didn't work out, but not due to the proximity factor tool.
4. Brent discussed potential Cracker Hammock and Skipper Ranch mitigation options, also occurring within the Fisheating Creek basin. FDOT's Intent for these improvements is to connect conservation lands from SR 70 up to Highlands Hammock State Park. SWFWMD indicated that they generally don't like Conservation Easements as a mitigative measure but will consider them for parcels that are "large enough" and provide a significant ecological lift (benefit). SWFWMD also noted these were out of the basin with the impacts and cumulative impacts would need to be addressed.

6. Schedule

a. The permitting application submittal schedule is preliminarily anticipated for Fall 2025. The permitting aspects and schedule discussed are subject to change.
b. Sam mentioned that this project is anticipated to be let as Design/Build, so the plans may be more consistent with a concept plans, in lieu of the traditional FDOT Phase II plans.

Purpose of Meeting:
Geotechnical Groundwater Coordination for SR 70, Segments 12-14:

- Segment 12 from Jefferson Ave to US 27 (414506-3)
- Segment 13 from SR 70 from US 27 to CR 29 (414506-4)
- Segment 14 - CR 29 TO Lonesome Island Rd (414506-5)

Date of Meeting
5-8-24, 3:30-4:30 pm

Location:
Microsoft Teams

Invitees:
Joe Lauk (PGA), Melody Joyner (FDOT), Kisan Patel (FDOT), Ryan Molloy (FDOT), Brent Setchell (FDOT), Dave Crombie (HNTB), John Burton (HNTB), Sam Chiu (HNTB), Ed Ponce (HNTB), Angela Shepard (HNTB), John Fowler (HNTB), Larry Moore (Tierra), Dylan Nelson (Tierra), Kaitlyn Waterman (Tierra)

Objectives:
Concurrence on SR 70 Base Water Clearance Elevation Methodology

Agenda & Notes

1. Introductions
2. SR 70, Segments 12-14 – John Burton
    a. Project Overview
    b. Status of project/Schedule. Concurrent PDE/Design Project. PDE phase underway and nearing completion. Design is underway.
        i. Critical Path: Line & Grade
        ii. Key Issue: Finalize Base Clearance Water Elevation
    c. Segment 14
        i. Overview – **Angela**
            1. Schedule – PD&E ongoing, design began in early 2024.
            2. Limits from CR 29 to Lonesome Island Rd
            3. Existing/Proposed Typical section
                a. Adjacent agricultural canals for entire length drain into SFWMD canals just east of project limits.
                b. Existing roadway built on muck embankment, past geotechnical studies
        ii. Preliminary field work and findings to-date
            1. Geotech SHWT at 500' intervals – **Dylan and Kaityn**
                a. Along much of the Segment 14 roadway alignment, Tierra has estimated the **historical/natural** SHW levels to be **above existing grade**.
                b. USDA reports SHW levels above existing grade.
                c. Historical aerial photography shows the entire area (north and south of the existing SR 70 roadway) was once a wetland prior to canal/farmland development.

d. Above grade seasonal high hand auger borings mostly encountered **muck at the ground surface** in thicknesses ranging from 1 to 5 feet. In some cases, the bottom of the boring terminated in muck.
e. Design Team is awaiting survey elevations of biological indicators in natural wetlands in order to determine the SHW elevation (above the existing ground surface).

2. Man-made influence of canals on water table – **Dylan and Kaitlyn**
   a. Groundwater levels encountered in Tierra borings generally range from 1 to 5 feet below ground surface in areas where SHW is estimated above existing grade.
   b. Canals are owned/maintained by private land-owners.
3. Spot measurements of stain lines at culvert headwalls – **Angela**
4. Ongoing effort to pick up biological indicators (presence of wetland plants) within the canals and at historical wetlands – **Angela**

iii. Design Approach
1. Governing criteria – **Angela**
   a. Base clearance, BCWE (24-hr stage in linear ponds)
   b. Dry pond recovery in 72 hours
2. Potential effects of using historic SHWT impacts on proposed roadway profile – **Angela**
3. Potential approach to consider effects of groundwater drawdown due to man-made canals in roadway and drainage designs – **Angela, Dylan, and Kaitlyn**
   a. Use canal water levels, stain lines at culverts and biological indicators within canal banks as control water elevations for design
   b. Risks with this approach
      i. Canal maintenance, stages, and related discharges to or withdraws from are controlled by by adjacent agricultural properties
      ii. Potential impacts to waters of the state (permitting issues)

d. Segments 12-13

i. Overview – Sam
1. SR 70 from Jefferson Ave to CR 29
2. Due to the presence of utilities (FP&L and FGT) and conservation lands (Lake Wales Ridge WEA and Archbold Biological Station), the PD&E approach is to provide linear ponds and floodplain compensation areas directly adjacent to the proposed roadway.
3. The PD&E did not have survey and geotech.

ii. Data Available
1. Geotech SHWT at 500' intervals – **Dylan and Kaityn**
   a. Tierra estimated the SHW levels along the roadway alignment within these segments based on soil indicators (spodic horizons, etc.), existing topography, groundwater levels encountered within the borings, and information provided in the USDA Soil Survey.
   b. Average SHW levels are generally 1½ to 2 feet above encountered groundwater levels in January 2024.
2. Stain lines on culvert endwalls – **Sam**
3. 100-year floodplain elevations from SWFWMD Model – **Sam**

4. Estimated peak stage in natural depression – **Sam**
5. Previous SHGWT and weir elevations from permitted linear ponds – **Sam**
6. Gage at Lake Annie Ditch – **Sam**

iii. Comparisons – **Sam**

1. The estimated SHGWT are compared with the existing ground elevation at low edge of traffic lane.
    a. The minimum separation is about 1 ft.
    b. ~15% of the borings have 1- to 2-ft separation between the estimated SHGWT and the existing ground elevation at low edge of traffic lane.
    c. ~20% of the borings have 2- to 3-ft separation between the estimated SHGWT and the existing ground elevation at low edge of traffic lane.
    d. ~15% of the borings have 3- to 4-ft separation between the estimated SHGWT and the existing ground elevation at low edge of traffic lane.
    e. ~50% of the borings have >4-ft separation between the estimated SHGWT and the existing ground elevation at low edge of traffic lane.
2. The stain lines on endwalls are lower than the adjacent estimated SHGWT
3. Some 100-year floodplain elevations are lower than the estimated SHGWT
4. The estimated SHGWT are compared with the previous SHGWT and weir elevations from permitted linear ponds
    a. 11 of the borings have comparable estimated SHGWT and the previous SHGWT (+/- 1-ft)
    b. 3 of the borings have the estimated SHGWT higher than the previous SHGWT
    c. 4 of the borings have the estimated SHGWT lower than the previous SHGWT
5. The estimated SHGWT are compared with the gage data at the Lake Annie Ditch
    a. Lake Annie Ditch surface water elevation fluctuate seasonally between EL. 110 and 111.5
    b. The estimated SHGWT is within this range

iv. Design Approach – **Sam, Dylan, and Kaitlyn**

1. Constraints
    a. Limited R/W
    b. 3’ base clearance above linear ponds + 1’-9” above SHGWL for linear ponds (4’-9” total)
2. Base clearance: Both estimated SHW levels **and** encountered groundwater levels (hand auger borings performed in January 2024) show that existing roadway grades in some areas would need to be raised in order to meet linear swale treatment and base clearance requirements.
3. Linear ponds: may not fit within the limited roadway R/W; may not be conducive to high groundwater table
4. Floodplains: SWFWMD floodplain model will need to be updated to reflect a higher initial stage and potential higher floodplain elevation

Purpose of Meeting:
SR 70 Segments 9-10 – SR 31 to DeSoto/Highlands County Line (451690-1 & 451942-1)
SR 70 Segments 12-13 – Jefferson Avenue to CR 29 (414506-3 & 414506-4)
Drainage Kickoff Meeting

Date of Meeting
May 13, 2024, 1:00pm

Location:
Microsoft Teams

Attendees:

- FDOT – Brent Setchell, Ryan Molloy
- FDOT GEC (PGA) – Joe Lauk
- HNTB – Ed Ponce, John Burton, John Fowler, Matt Dockins, Sam Chiu

Attachment: See presentation slides attached.

Agenda & Notes

1. Introductions
2. Overview
    a. Strategic Corridors – State Road (SR) 70
        i. Segments 9 and 10 (FPIDs 451690-1 and 451942-1)
            1. It is a concurrent PD&E and Concept Design
        ii. Segments 12 and 13 (FPIDs 414506-3 and 414506-4)
            1. It has a previous standalone PD&E and the current phase is Concept Design.
3. Roadway Typical Sections
    a. Segments 9 and 10
        i. Existing
            1. Two lane undivided roadway
            2. From Turkey Hammock to 1-mile west of County Line has passing lane added under FPID 420983-1
            3. There are existing path and access road on the north side that may need to be restored
                a. Joe clarified that it would be great to re-established, but not a must condition
        ii. Proposed
            1. Four lane divided roadway
            2. Two roadway alternatives being evaluated
    b. Segments 12 and 13
        i. Existing
            1. Two lane undivided roadway
        ii. Proposed
            1. PD&E divided the project into three typical sections due to the varying existing and proposed right-of-way
            2. Concept Design is refining the roadway typical sections
4. Conservation Lands
    a. Segments 9 and 10 – None directly adjacent to the project
    b. Segments 12 and 13 – Western portion within Segment 12 is bounded by the Lake Wales Ridge Wildlife and Environmental Area (LWRWEA) and Archbold Biological Station.

5. Water Management District Boundaries
    a. Segments 9 and 10 – Fully contained in Southwest Florida Water Management District (SWFWMD).
    b. Segments 12 and 13 – Mostly in SWFWMD, but the eastern end is within South Florida Water Management District (SFWMD). The Interagency Agreement executed March 24, 2018 delegated the permitting authority for the entire limits of this project to the SWFWMD.
6. Existing Permitted Ponds
    a. Segments 9 and 10
        i. About 1.2-mile of existing linear ponds were added on both sides of SR 70 for the widening under FPID 193896-1.
        ii. About 5.6-mile of existing linear ponds and 0.4-mile of existing linear floodplain compensation sites (FPCs) were added on the north side of SR 70 for the passing lane under FPID 420983-1.
    b. Segments 12 and 13
        i. Four existing linear ponds were added on the south side of SR 70 for the Georgia Pacifica Access Road project.
        ii. Four linear ponds have been added at the SR 25/SR 70 Intersection for the intersection improvement under FPID 439827-1.
            1. Brent clarified that the project is nearly completed.
        iii. Ten existing linear ponds were added on both sides of SR 70 for the intersection/turn lane improvements under FPID 194437-3.
7. Base Clearance
    a. The base clearance water elevations for both projects are ongoing; however, the preliminary results show generally high ground water table.
        i. Brent noted that there are no known issues or overtopping with the exception of the RV Parking east of US 27. HNTB will request more information on this flooding.
    b. The intent is to follow the guidance outlined in Drainage Manual 5.4.1.1.
        i. Brent concurred.
8. Stormwater Management
    a. Segments 9 and 10
        i. The intent is to evaluate both linear ponds and offsite ponds.
        ii. Sam noted that the use of linear ponds will need to evaluate in conjunction with the roadway as it has cost implication to roadway profile and roadway right-of-way.
    b. Segments 12 and 13
        i. PD&E identified 1 alternative per basins. However, PD&E did not have survey, geotechnical data, and roadway profile.
        ii. The Concept Design will perform the design level Pond Siting Analysis.
    c. Water Quality
        i. The proposed improvements will address the nutrient impaired water bodies by demonstrating net improvement and meet SWFWMD's 150% of presumptive treatment volume for direct discharge to the Placid Lakes Outstanding Florida Water (OFW).
        ii. The Project Development and Environment (PD&E) study is expected to be complete approximately Summer of 2025 and therefore, should fall under the current stormwater rules.
        iii. In the area that the existing ponds are being impacted, it will need to provide treatment to the new impervious plus offsetting the existing treatment volume.
            1. Brent concurred.

d. Water Quantity
    i. In open basins, the proposed improvements will need to demonstrate the post development peak discharge rate does not exceed the pre development using SWFWMD's 25-year 24-hour storm event.
    ii. In closed basins, the proposed improvements will need to demonstrate the post development discharge volume does not exceed the pre development using FDOT's 100-year 240-hour storm event.
e. Floodplains
    i. Part of the project is located within the Lake Placid watershed model. The project will use this watershed model as the best available information. Further evaluation may be necessary to model initial stages and the project specific seasonal high water.
    ii. In the area without the watershed model, the Federal Emergency Management Agency (FEMA) map will be utilized as the best available information. Cup-for-cup compensation is the anticipated approach for those areas.
        1. In the area with historic basin storage, but not mapped as 100-year floodplain, the project will also need to demonstrate compensation or no adverse impacts.

Segment 12-13 Interagency Agreement

INTERAGENCY AGREEMENT BETWEEN
THE SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT
AND THE SOUTH FLORIDA WATER MANAGEMENT DISTRICT
FOR THE DESIGNATION OF REGULATORY RESPONSIBILITY FOR AN
ENVIRONMENTAL RESOURCE PERMIT FOR THE
SR 70 PROJECT IN HIGHLANDS COUNTY

THIS INTERAGENCY AGREEMENT (Agreement) is made and entered into by and between the SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT (SWFWMD) and the SOUTH FLORIDA WATER MANAGEMENT DISTRICT (SFWMD).

WITNESSETH:

WHEREAS, The Florida Department of Transportation (FDOT) is seeking an environmental resource permit for construction of road improvements and associated stormwater facilities along an approximately 7-mile portion of SR 70, from east of Jefferson Avenue to CR 29, in Highlands County, Florida. (SR 70 Project); and

WHEREAS, the beginning of the SR 70 Project falls under the jurisdiction of SFWMD, and then the project continues along the geographical boundary between SFWMD and SWFWMD until it again falls under SWFWMD's jurisdiction, and then ends in SFWMD's jurisdiction. See project map attached as "Exhibit A."

WHEREAS, the geographic area of the SR 70 Project includes portions of Highlands County that are located within the jurisdictional boundaries of SWFWMD and SFWMD; and

WHEREAS, Subsection 373.046(6), Fla. Stat., authorizes a water management district to designate, via an interagency agreement, regulatory responsibility to another water management district when the geographic area of a project or local government crosses water management district boundaries; and

WHEREAS, the designation of the SWFWMD as the water management district with Part IV, Chapter 373, Fla. Stat., regulatory responsibility for the SR 70 Project would allow for more efficient processing of permit applications under that part; and

WHEREAS, the SWFWMD and the SFWMD desire to designate the SWFWMD as the water management district with Part IV, Chapter 373, Fla. Stat., regulatory responsibility for the SR 70 Project, pursuant to Part IV, Chapter 373, Fla. Stat.;

NOW THEREFORE, the SWFWMD and the SFWMD, under the authority of Subsection 373.046(6), Fla. Stat., hereby agree as follows:

1. The SFWMD hereby designates to SWFWMD all regulatory responsibilities under Part IV of Chapter 373, Fla. Stat., for those activities associated with the SR 70 Project that lie within the jurisdictional boundaries of SFWMD. Such regulatory responsibilities shall include receiving, processing, and taking final agency action on all environmental resource permit applications, or modifications thereof, and taking any compliance and enforcement action with regard to such permit.

2. This Agreement will commence upon execution by all parties and will remain in effect until either party terminates such agreement for its convenience upon ninety (90) days written notice to the other party.

IN WITNESS WHEREOF, each party, or its lawful representative, has executed this Agreement on the date set forth next to their signature below.

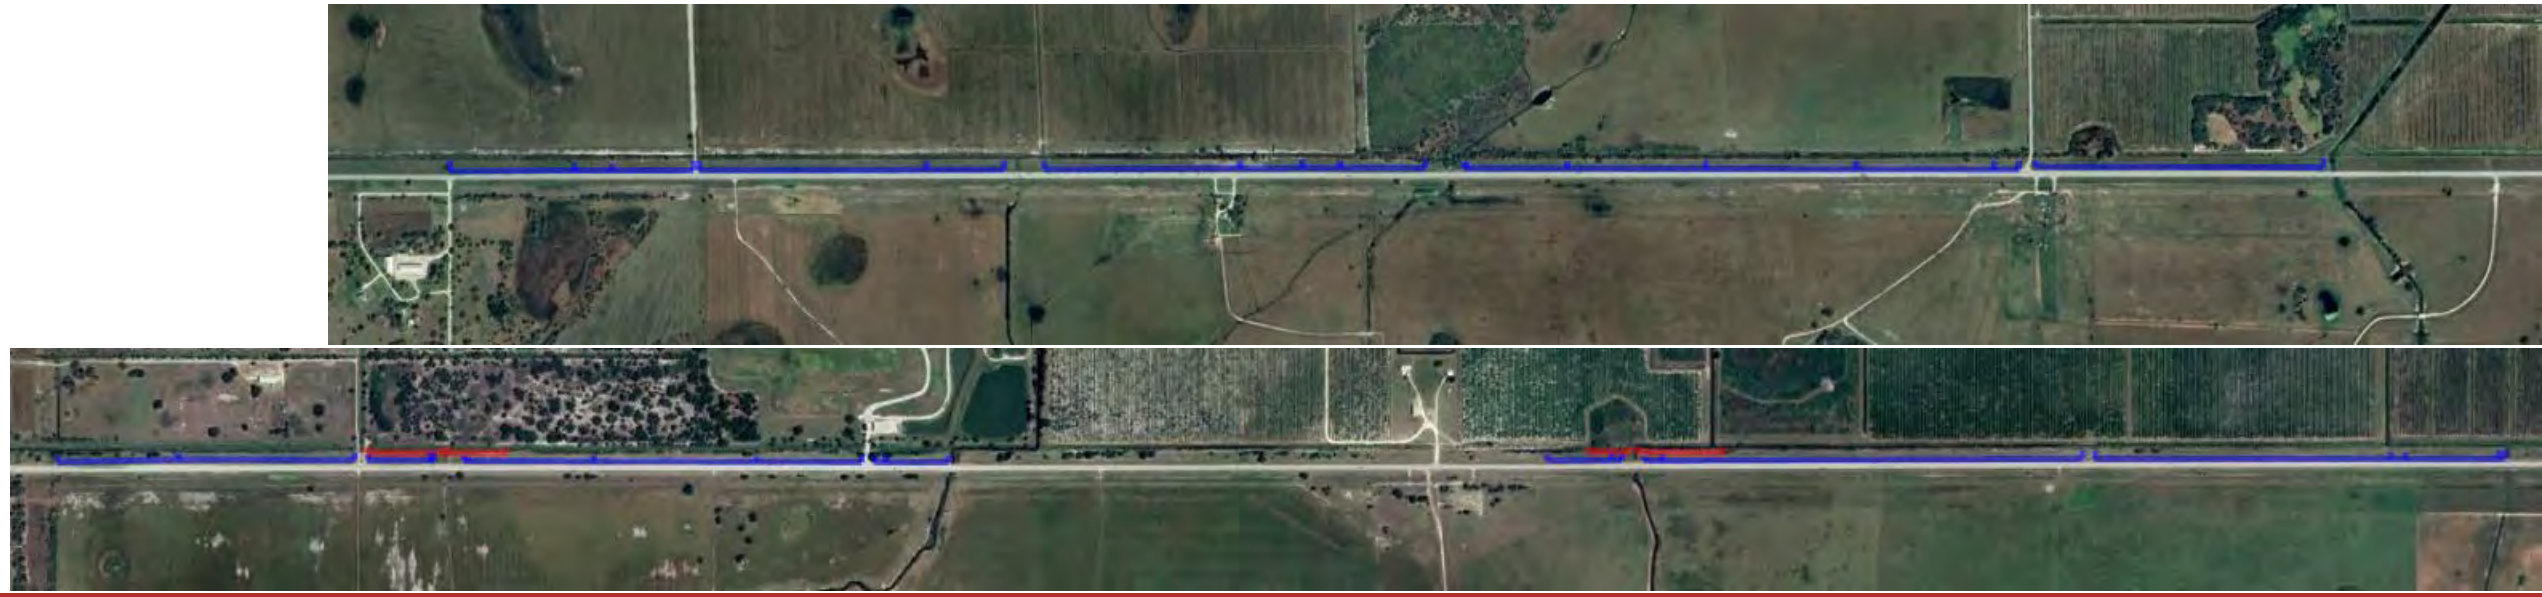
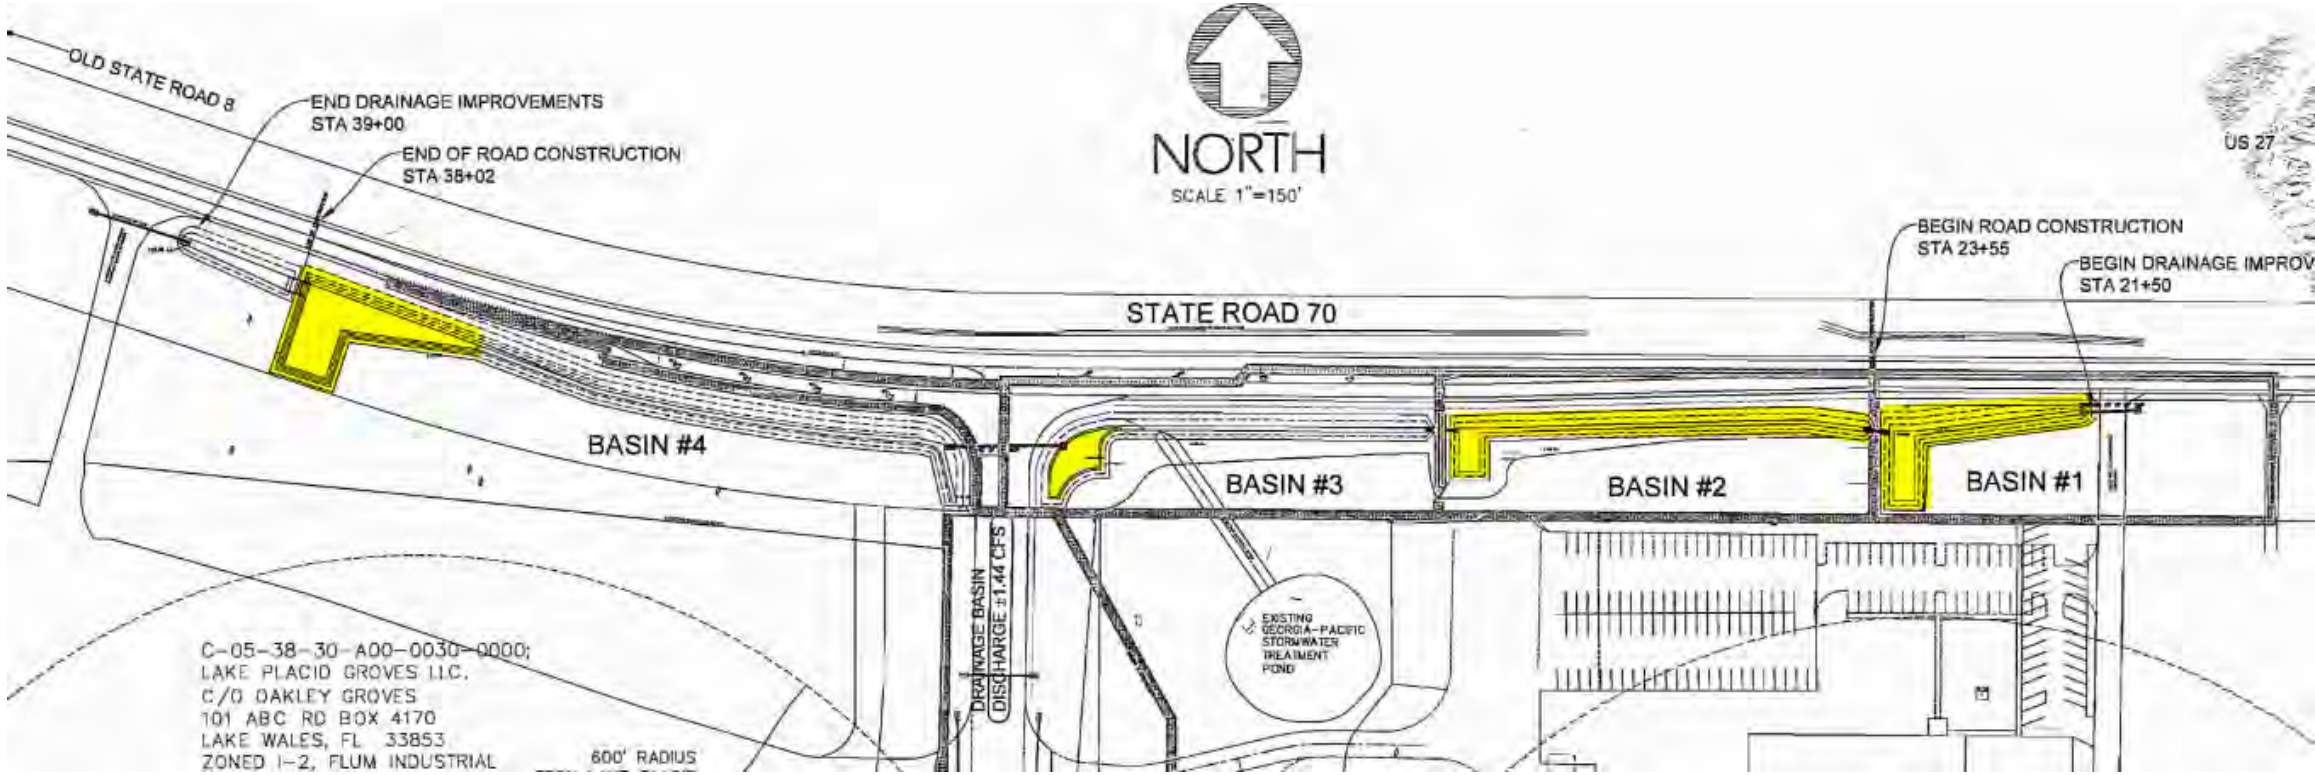
Senior Attorney



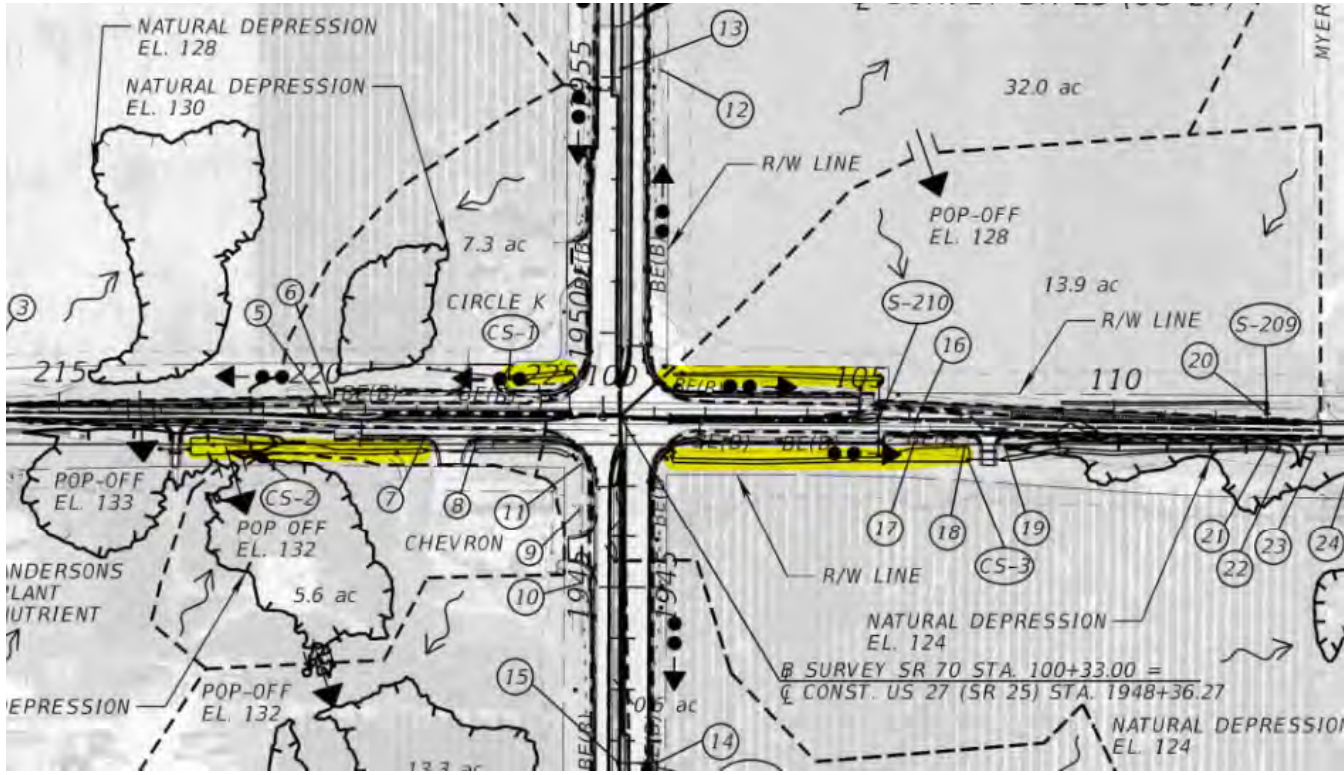
Segment 9-10 Existing Linear Ponds & FPCs

- ✓ FPID 193896-1
  - ✓ SR 70 Widening (Turner Ave to SR 31)
  - ✓ 1.2-mile of existing linear ponds (both sides)



Segment 9-10 Existing Linear Ponds & FPCs

- ✓ FPID 420983-1
  - ✓ SR 70 Passing Lanes (Turkey Hammock Rd to 1-mile west of County Line)
  - ✓ 5.6-mile of existing linear ponds (north side)
  - ✓ 0.4-mile of existing linear FPCs (north side)



Segment 12-13 Existing Linear Ponds

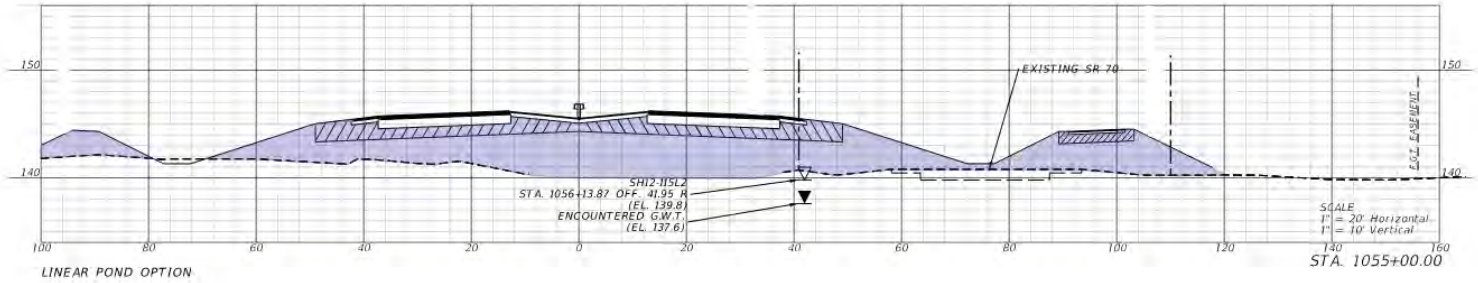
- ✓ Georgia Pacific Access Rd
  - ✓ Four existing linear ponds (south side)

Segment 12-13 Existing Linear Ponds

- ✓ FPID 439827-1
  - ✓ SR 25/SR 70 Intersection Improvement
  - ✓ Four existing linear ponds (both sides)
  - ✓ Under construction

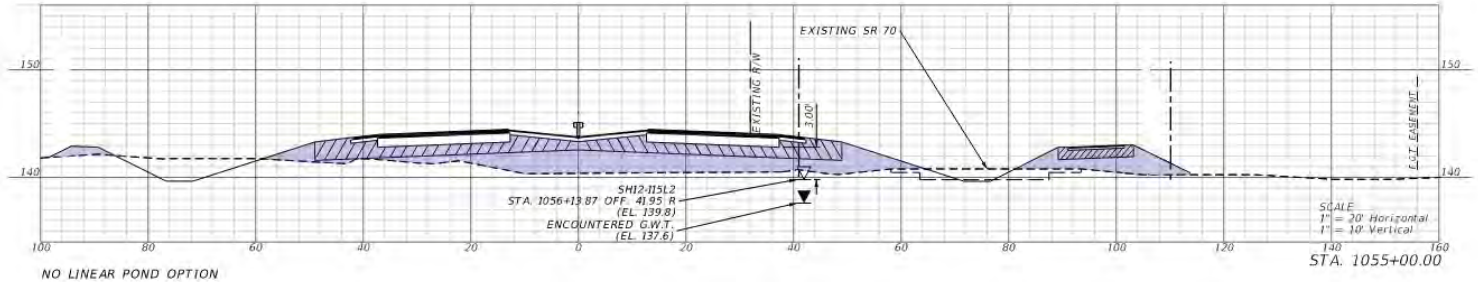
Segment 12-13 Existing Linear Ponds

- ✓ FPID 194437-3
  - ✓ Intersection/Turn Lane Improvement
  - ✓ Ten existing linear ponds (both sides)



Base Clearance

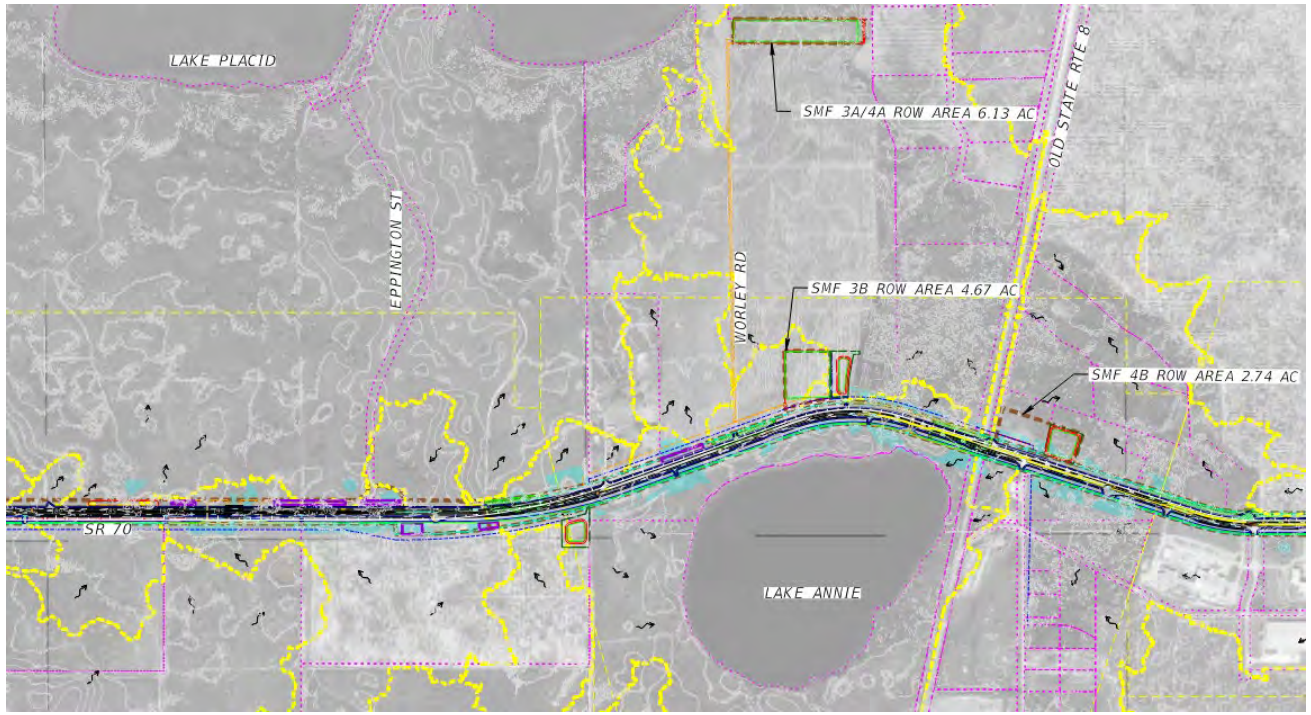
- ✓ 3’ Base Clearance
- ✓ Weir Elevation for Linear Ponds
  - ✓ Drainage Manual 5.4.1.1
- ✓ Geotech Estimated SHGWT
  - ✓ Generally high
  - ✓ Segments 9-10
    - ✓ Under Review
  - ✓ Segments 12-13
    - ✓ 15%: 0’-1’ existing base clearance
    - ✓ 20%: 1’-2’ existing base clearance
    - ✓ 15%: 2’-3’ existing base clearance
    - ✓ 50%: >3’ existing base clearance
    - ✓ Pending additional verification



Base clearance is the distance between the bottom of the roadway base and the top of the base clearance water elevation (BCWE). The BCWE is considered the long-term standing water which could negatively affect the structural integrity of the roadway base. Allowable base clearances are based on the roadway's classification and are provided in **FDM 210.10.3**.

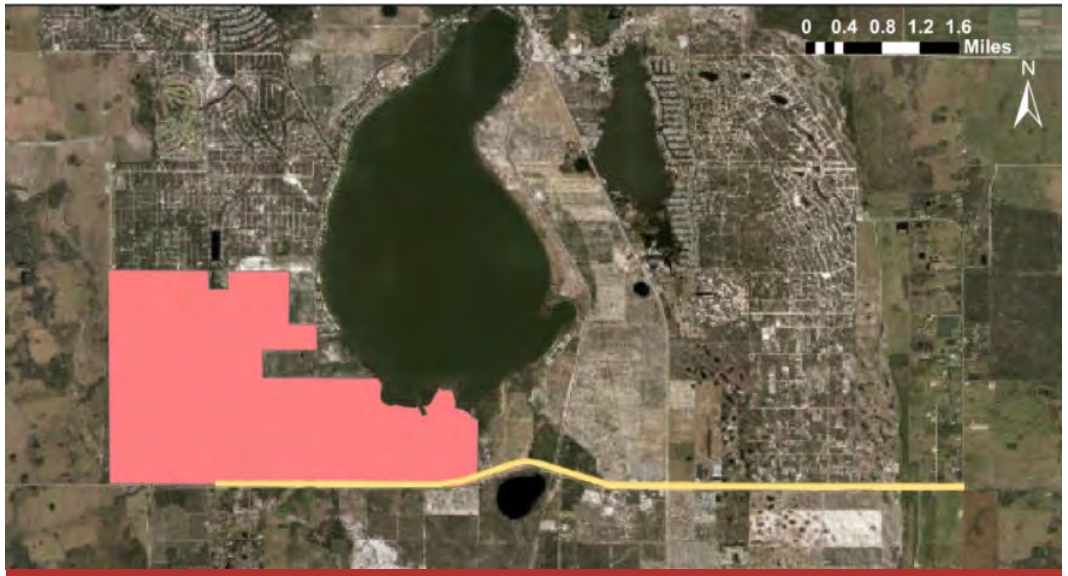
The BCWE for roadside treatment swales should be set at the weir elevation. A lower elevation may be used if all of the following apply:

- In-situ soils are classified as Hydrologic Soil Group A,
- Geotechnical investigation reveals there is no confining layer to impede drawdown, and
- Construction activities are limited within the treatment swale to avoid compaction and tracking of silt and muck.



LINEAR POND OPTION

NO LINEAR POND OPTION



Pond Siting & Stormwater Management

- ✓ Segments 9-10
  - ✓ Linear Ponds
  - ✓ Offsite Ponds
- ✓ Segments 12-13
  - ✓ PD&E identified 1 alternative per basins
    - ✓ PD&E did not have survey and geotech
    - ✓ PD&E did not have a roadway profile
  - ✓ Utility Easements – FP&L & FGT
  - ✓ Linear Ponds in Conservation Land
  - ✓ Offsite Ponds
  - ✓ Combine Basins?

Pond Siting & Stormwater Management

MEETING MINUTES

Project Name
SR 70 Segments 9-10, 12-14

Date of Meeting
September 9, 2024

FPID(s)
451690-1, 451942-1, 414506-3, 414506-4, 414506-5

Location
D1 HQ, Microsoft Teams

Purpose of Meeting
Drainage Pond Siting Schedule

Time
2:00 PM – 3:00 PM

Attendees:

- **FDOT – Joe Lauk (PGA), Brent Setchell, Melody Joyner, Melissa Slater**
- **HNTB – Bill Jones, Ed Ponce, John Burton, Sam Chiu, Angela Shepard, Matt Dockins, Gordon Mullen, Dave Crombie**

Agenda & Notes

1. Introductions & Agenda
    - Pond siting is critical path for both PD&E and design. Regular check-ins will help expedite schedule and make sure we are on the right track.
    - Meeting purpose to review project schedules and identify decision points for pond siting activities.

2. Segment 9-10, 12-14 schedules:
    - Discussed draft schedule of activities for concurrent PD&E and design related to pond siting.
    - During the meeting, comments and revisions made to the draft schedule included the following:
        - Pond Siting Alternatives Analysis will include preliminary environmental desktop analysis.
        - Brent suggested having a check-in meeting to confirm alternates before starting the field work (exploratory Geotech and Environmental). This will be accomplished in Checkpoint Meeting #1
        - Brent suggested an additional check in meeting prior to submission of the Draft PSR (Meeting #2). This meeting will discuss estimated costs & impacts and identify preliminary recommendations to incorporate in the Draft PSR.
        - Full field investigation (Geotech and Topo Survey) may begin after Draft PSR.
        - Meeting #3 will be scheduled prior to Final PSR submittal to confirm final recommendations.
        - After confirmation of final pond site recommendations, preliminary right of way process activities, including title searches and mapping up to 60%, may begin. For purposes of the pond siting schedule, right of way activities will be reflected in two lines for preliminary and final effort (appraisals, etc).

- Bill displayed a graphic illustrating the Segment 14 LDCA will be achieved by December 2024 and noted that this allows for ROW acquisition and permitting package submittals in advance of the other segments.
- Bill noted some funding for right of way and/or mitigation will be available in FY 2026.
- An additional schedule line will show the anticipated Segment 14 re-evaluation timeline. Anticipated 6-month timeline should be complete by August 2025, prior to 60% plans and SFWMD permit application.
- Dates related to DB procurement are subject to change.

3. Pond siting methodology, approach, preliminary alternate sites discussion.
    - Segment 14
        - Angela reviewed the current PD&E alternates and recommendations, three alternative stormwater management facility types for 3 basins (offsite wet detention, linear ponds, regional pond), and 2 FPC sites with 2 alternates identified for each site.
            - FPC 2A (PD&E recommended) is now a planned FPL Solar Farm site. Unless it is anticipated this is still a viable site, an additional alternate site will be needed to replace FPC 2A.
            - FPC 1A (PD&E recommended) may impact adjacent wetlands with modeled SHWT. Recommendation may change to FPC 1B or third alternate (TBD).
            - Preliminary cost differences estimated for the LRE memo comparing alternative stormwater management facility types will be expanded and incorporated in the PSR.
        - Angela identified next steps for updating the ICPR floodplain model with design-level information as it becomes available. Brent had no comments on the overall approach.
            - Brent agreed that initial stage shouldn't be at canal bottom. FP model updates will incorporate the recent canal SHW/NWL determinations.
            - Angela noted upcoming Draft BHR will be based on the current PD&E FP model and will be refined in the Final BHR when FP model updates for roadway design geometry and topo survey are incorporated. Joe and Brent have concerns about the BHR rework if survey data is not available. John noted available LiDAR has been reasonably accurate compared to survey to-date. Joe inquired if the BDR/BHR is on the critical path. Angela noted the BDR/BHR schedule is aligned with the current design schedule.
            - The current FP model reflects permitted (future) conditions for some offsite wetland restoration project sites. Updates needed to replace FP model input with existing conditions data.
                - In order to update the FP model with the best available (permit) data, Angela requested approval to contact offsite property owners for ICPR data not available from SFWMD or KCA. Brent had no concern with contact.
            - Anticipated that upcoming ICPR model updates may result in increases in FP impacts and corresponding FPC site sizes.
                - If viable sites are not available, will revisit other opportunities with less favorable schedule impacts.
    - Segment 13
        - PD&E provided one alternative per basin. Updates will include 3 per basin.
        - HNTB to request flooding complaints for the RV site

- Brent alerted the team about the isolated depressions, which may have clay/organic materials to cause the impoundment. Brent also noted the odd topography in proximity to seepage slope.
- Will need model to estimate floodplain elevations in depressions.

- Segment 12
  - PD&E provided one alternative per basin. Updates will include 3 per basin. Basins 1 and 2 include linear pond options as suggested in the PD&E. Basins 3 and 4 have a regional alternative.
  - Initial stages in the watershed model will be updated to reflect recent SHWT determination. Updates may result in increases in FP impacts and corresponding FPC site sizes.
  - Discussion about the roadway realignment shift north due to FP&L.
  - Brent asked if the EB roadway is re-using the existing. HNTB indicated that is for Segment 9-10.
- Segments 9-10
  - Existing FGT and FP&L easements
  - HNTB indicated that there are owners that has multiple large parcels. Will look for opportunities to minimize impacts to owner or combine basins.
  - Basin delineation and CN calculations underway.
  - No previous sites identified. Three alternatives per basin will be provided, including linear ponds as an option. The current roadway design fit inside the existing roadway R/W. Any differences in project costs due to linear ponds will be accounted for in the PSR.
  - FPC sites will be identified offsite.
  - Potential pond sites may not be directly adjacent to roadway due to FPL and FGT easements.
  - Survey anticipated in early December. LiDAR will be used in the meantime.

4. Additional general discussion for PSR methodology:
   - Brent's preference is to locate pond sites close to R/W
   - When sizing pond, use 1.0 to 1.5 ft of treatment depth. Include consideration for impacts to roadway profile and cost benefit of expanding pond footprint.
   - If a shallow treatment depth is used (such as 0.5 ft), this will need justification if that is due to roadway profile. Should include a comparison of the larger pond vs. roadway cost (raising roadway profile that affect roadway R/W and roadway embankment)
   - Alternative cost estimates should include all costs associated with ponds, such as outfall and easements, and other differential costs (higher roadway profiles or additional corridor right of way).
     - Include consideration for pipes will connect to ponds. Potential example of combining basins that requires a deeper pipe to traverse cross drain locations.

5. Action items:
   - Update pond siting project schedules, see attached.
   - Schedule check in meetings.

MEETING NOTES

- PD&E Concepts – Access Overview
  - Segments 12/13
    - Access Class 03
    - Directionals only
    - Signalized median u-turn at US 27
    - Some bulb-outs for truck u-turns
  - Segment 14
    - Access Class 03
    - Mix of directional and full openings
    - Already had public hearing
- Proposed Design Modifications
  - Areas of paved shoulder widening to accommodate Passenger Vehicle u-turns
    - Walter wants to accommodate a larger crew-cab type pickup truck with extended bed at all u-turn locations
    - **Action: HNTB to run AutoTurn to verify that a larger pickup can make the u-turn movement**
  - Walter would like to look at the concept further and provide feedback
  - Remove opening at Sta. 1100+00
  - Remove opening at Sta. 1198+00
  - Can't easily build new loons
  - Maybe accommodate large trucks 1x per mile
  - SR 82 Lesson Learned: Sight line issue from lack of offset left turns

    - Need for offset left turns depends on future traffic volumes
- Walter doesn't like combining a loon with a side street if the side street is expected to have any significant volume
- Realign Old SR 8
    - Significant truck movements observed
    - Realign northern leg
    - Create 4-leg signalized intersection
    - Requires additional R/W
    - Impacts FGT transmission line
    - Need a signal warrant to construct a signal
        - Action: HNTB to perform a signal warrant analysis
    - Need ICE analysis
        - Would a roundabout work?
        - Can still construct a roundabout without a warrant
    - May want to do a cost analysis of Old SR 8 realignment
- Several modifications between RR tracks and US 27
- FP&L looking at expansion with driveway near SE corner of Glades Electric substation
    - Any new driveway would need to be east of the orange grove
- Median u-turn (MUT) at US 27 is preferred option
    - Walter will verify the ICE analysis was completed
- Unsignalized Green T at CR 29
    - Need ICE analysis
- Reach out to Susan Joel before starting ICE analysis
    - Susan.Joel@dot.state.fl.us

MEETING MINUTES

Project Name
SR 70 Segments 12-14

Date of Meeting
February 4, 2025

FPID(s)
414506-3, 414506-4, 414506-5

Location
D1 HQ, Microsoft Teams

Purpose of Meeting
Analysis with Multi-Functional Team: Coordination of ROW, Parcels, Alternate Viability, Property Owner Contact, Access Conveyance Requirements, and Assessment of Aesthetic, Social, Cultural, and Environmental Impacts of Each Alternate. Confirm Sites for Preliminary & Environmental Field Work. Drainage Pond Siting & Exploratory Borings Sign-Off

Time
1:00 PM – 2:00 PM

Attendees:

- **FDOT – Brent Setchell, Eric Collier, Joe Lauk (PGA), Ryan Molloy, Brooke Feagle (AtkinsRéalis), Kathryn Cothern**
- **HNTB – Angela Shepard, Braeden Johnson, Ed Ponce, John Burton, John Fowler, John Fowler, Matt Dockins, Nic Leon, Sam Chiu**

Agenda & Notes

1. Introductions & Agenda

- The primary focus of this meeting was to review pond siting progress and obtain concurrence for exploratory borings and environmental surveys to further evaluate site alternatives.

2. Segment 14

- LDCA is anticipated 04/2025 and re-evaluation is scheduled to be completed 12/2025.
- The Stormwater Management Facility (SMF) alternatives for the three drainage basins (three cross drains) are generally consistent with the 2023 PD&E. The updated evaluation and recommendations will incorporate most recent data collection, estimated impacts, and estimated construction costs.
    - Stormwater Management Alternative 1 (Linear Ponds)
        - Positioned within the 60-ft minimum horizontal offset, between travel lanes and adjacent canal hazards, along both sides of SR 70. The linear ponds extend throughout entire Segment 14 limits.
        - Due to profile gradient and driveway locations, multiple cells are anticipated for each of the three basins.
        - Basin 1: 16 cells
        - Basin 2: 22 cells
        - Basin 3: 13 cells
    - Stormwater Management Alternative 2 (Offsite Wet Detention Ponds)
        - Ponds are positioned adjacent to, and outfall into the agricultural canals along SR 70. Easements are required for access and conveyance from roadway into ponds, which will cross beneath the bottom of canal (canal depths vary, approximately 5-feet from

bottom to top of bank), and pond outfalls back to the canals. The corresponding maximum pond depths to accommodate deeper conveyance pipes are not expected exceed 12-feet below the normal water level.

- Potential constructability/dewatering concerns were discussed for pipes crossing beneath the canals. However, for ponds located south of SR 70, the anticipated construction phasing would allow installation of pipes prior to the relocation of the south canal.

- Basin 1: No change to the location of SMF 1 site. Some adjustment to pond size to provide entirety of required attenuation volume versus partial storage within roadway corridor.
- Basin 2: The 2023 PD&E located SMF 2 on the north side of SR 70. This location is the basis of the roadway design shown in the 30% concept plans. However, recent data collection and re-evaluation favors a SMF 2 relocation to the south side of SR 70. Improvements discussed include constructability of conveyance beneath the canal and a lower ESHWT (tailwater) between the north and south canals. The design team estimates a potential roadway profile reduction of approx. 1.5-feet if the pond is repositioned to the south.
    - Remove SMF 2 (north) and replace with SMF 2 (south) for further evaluation.
- Basin 3: No change to the location of SMF 3 site. Some adjustment to pond size to provide entirety of required attenuation volume versus partial storage within roadway corridor and pond repositioned south of the relocated canal.

o <u>Stormwater Management Alternative 3 (Regional Pond)</u>

- No change to site location. Alternative to include both a land use swap for water quality and wet detention for water quantity.
- Right of way, access easements, and conveyance easements will require further evaluation to verify need, appropriate designation, and avoidance of severing remnant parcel usage and access.
- Potential utility involvement with FGT

o <u>Floodplain Compensation (FPC) Areas</u>

- Zone A Floodplains present in majority/middle of Segment 14 limits. Modeling is the approach to define required compensation. Updates to 2023 PD&E model are in progress to incorporate latest and best available design information and confirm compensation needs. 2023 PD&E estimated 48.5 ac-ft will be required.
- Compensating storage is generally unavailable in the middle portion of the project due to high groundwater tables but is available along each side of Zone A limits, on the west (FPC 1's) and east (FPC 2's).
- Alternate Sites discussed:
    - FPC 1A – same location as PD&E. Remove from further evaluation due to unavailability of compensation storage (ESHWT 41.6 to 42.9 above 100-year stage 39.3) and proximity to adjacent wetland.
    - FPC 1B - same location as PD&E. Site elevations vary from 34 to 40. ESHWT at upper elevations are above 100-year stage 34.7. Some floodplain storage capacity (2 ac-ft) still available without dewatering.
    - FPC 1C – new site, 1 parcel; group of smaller sites with limited footprint to avoid impacting private infrastructure. Approximately 7.7 ac-ft compensation volume available with current footprint. Potential for expansion if needed.

- FPC 1D – new site, 2 parcels; group of smaller sites with limited footprint to avoid impacting private infrastructure. Approximately 22 ac-ft compensation volume available. Potential for expansion if needed.
- FPC 2A – same location as PD&E. Remove from further evaluation due to planned FPL solar farm and unavailability of compensation storage (ESHWT 32.5 to 34.5 above 100-year stage 31.3).
- FPC 2B – relocate north to frontage portion of same parcel due to unavailability of compensation storage at previous location. Existing ground and approx. 1.5 depth to water table at frontage location has 29+ ac-ft of compensation storage available below the 100-year stage. Potential for expansion if needed.
- FPC 2C – (was not presented during the meeting) but was added for further evaluation as a location with viable storage availability.
- FPC 2D – new site; located between conservation lands on the north side of SR 70. Approx. 0.5-ft depth to apparent water table, controlled by discharge pump. If basis of storage capacity is nearest canal ESHWT, then site is not viable. Otherwise, with a 0.5-ft depth this site could provide 28 ac-ft of storage on a 59-ac site. Remove site from further evaluation due to unavailability of storage.

- FPC siting next steps:
  - a. Complete ICPR model updates to confirm required storage volumes necessary to avoid increasing watershed 100-year stages. Compare required storage volumes to available storage capacity at alternate sites and combine sites as necessary to group into three independent alternatives.
  - b. If a minimum of three viable alternatives are not available, the PSR will include supporting justification and clarification why remaining parcels have been removed from consideration.
  - c. If total available storage is insufficient, incorporate WRE future improvements in model and quantify the storage benefit during the 100-year event as a potential supplement to available FPC sites.
- FDOT Drainage concurred request to proceed with exploratory borings and environmental surveys on remaining alternative FPC sites with available storage including: FPC 1B, FPC 1C, FPC 2B (relocated), FPC 1D, and FPC 2C (new).

3. Segment 13

- LDCA has been shifted to beyond 06/28/2026. The pond siting is using the new water quality criteria.
- Stormwater Management
  - Basin 1303
    - An open basin within an impaired WBID.
    - Alternative 1 consists of SMF 1303A (wet pond) at SE corner of SR 70 and CR 29, and SMF 1303D (dry linear pond). SMF 1303D is added to upstream of the seepage slope to meet the new water quality criteria.
      - FDOT Drainage indicated that the latest guidance from CO is to use the ditch front slope and ditch block as a mean of nutrient removal to help meet new water quality criteria. Adding pond would not be the first solution.
      - HNTB added that SMF 1303D is located within the existing roadway right-of-way.
    - Alternative 2 consists of SMF 1303B (dry pond) at the NE corner of SR 70 and CR 29.
    - Alternative 3 consists of SMF 1303C (dry pond) at the SW corner of SR 70 and CR 29.

        - All three alternatives are located at the east end of the basin due to topography.
    - Basin 1302
        - A closed basin within an impaired WBID.
        - Alternative 1 consists of SMF 1302A (dry pond) between Highlands Blvd and Citrus Blvd. This alternative is located at the main depression.
        - Alternative 2 consists of SMF 1302B (dry pond) east of Citrus Blvd. This alternative is located at the secondary depression.
        - Alternative 3 consists of SMF 1302C (dry pond) at the SE corner of SR 70 and Turner Rd. This alternative is placed partially outside the closed basin.
    - Basin 1301
        - A closed basin within an impaired WBID.
        - Alternative 1 consists of SMF 1301A (dry pond) south of SR 70 and west of Brevard Ave.
        - Alternative 2 consists of SMF 1301B (dry pond) at the NE corner of SR 70 and Ekhoff Ln.
        - Alternative 3 consists of SMF 1301C (dry pond) at the NW corner of SR 70 and Brevard Ave.
        - All three alternatives are located near the cross drain, which is the at the bottom of the basin.
        - FDOT Drainage inquired where does the cross drain and channel drain to. HNTB clarified that it drains to the closed basin to the northeast.
- <u>Floodplain Compensation Areas</u>
    - Floodplain Impact Area (FIA) 1309
        - A depression is located south of SR 70 and 800-feet east of Bear Rd. This depression receives both onsite and offsite contributing areas in conjunction with the depression located behind a private single-family home.
        - Alternative 1 consists of FPC 1309A, which is located upstream of the depression at a higher elevation. This alternative intends to provide the required storage before the runoff contribute to the reduced depression.
        - Alternative 2 was discussed regarding placing a FPC west of the private property; however, this would result in surrounding the private single-family home with depressional storage on the west and south sides and the proposed roadway to the north side. Additional discussion with roadway and right-of-way to determine if this property requires to be whole-take given the roadway tie-down slope is adjacent to the private single-family home.
    - FIA 1308
        - Five isolated depressions are located on both sides of SR 70 from east of Citrus Blvd to east of Bear Rd. These depressions receive both onsite and offsite contributing areas.
        - An FPC was identified south of SR 70 at Bear Rd in the previous PD&E, which the floodplain elevations were determined using the NRCS equations.
        - A localized ICPR model with percolation links was created with this project to simulate the 100-year flood stage, which determined the impacts being minimal.
        - HNTB suggested obtaining geotechnical data to validate the perc link data. If confirmed, no FPC will be proposed. FDOT Drainage concurred with the approach.
    - FIA 1307
        - An isolated depression located north of SR 70 from Highlands Blvd to Citrus Blvd. The encroachment is due to the proposed SMF, which is sized to include the loss of existing storage.

- FIA 1306
  - An isolated depression is located at the southwest corner of SR 70 and Highlands Blvd.
  - Alternative 1 consists of FPC 1306A, which is located immediately east of the floodplain.
  - Given the location of the isolated depression, the compensation needs to occur within parcel C03383001000A00000 due to the hydraulics connectivity. No other alternatives have been identified. FDOT Drainage concurred with the approach.
- FIA 1305
  - Two isolated depressions located north of SR 70 from Broward Ave to Citrus Blvd. The encroachment is minor and demonstrate by comparing the loss of existing storage and the reduction in contributing area in these depressions.
- FIA 1303
  - An isolated depression is located at the south of SR 70 at Broward Ave.
  - Alternative 1 consists of FPC 1303A, which is located immediately south of the floodplain.
  - Given the location of the isolated depression, the compensation needs to occur within parcel C03383001000A00000 due to the hydraulics connectivity. No other alternatives have been identified. FDOT Drainage concurred with the approach.
- FIA 1301
  - A low area is located at the cross drain between Ekhoff Ln and Brevard Ave.
  - This area is not mapped as a floodplain in the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM).
  - A localized ICPR model with percolation links was created with this project to simulate the 100-year flood stage, which determined there are impacts to the loss of storage.
  - Alternative 1 consists of FPC 1301A, which is located north of the cross drain. This alternative will only be compatible with SMF 1301A as it is partially overlapped with SMF 1301B and SMF 1301C.
  - Alternative 2 consists of FPC 1301B, which is located southwest of the cross drain.

4. Segment 12

- LDCA has been shifted to beyond 06/28/2026. The pond siting is using the new water quality criteria.
- Stormwater Management
  - Basin 1204
    - A closed basin within an impaired WBID.
    - Alternative 1 consists of SMF 1204A (dry pond) north of SR 70 and 1,000-feet west of US 27.
    - Alternative 2 consists of SMF 1204B (dry pond) at NW corner of SR 70 and US 27.
    - Alternative 3 consists of SMF 1204C (dry pond) west of US 27 and 650-feet south of SR 70.
      - FDOT Drainage inquired about the conveyance from SR 70 to the pond. FDOT Drainage asked if there are existing conveyance is in place or if modifications are required.
      - HNTB indicated there is existing roadside ditch; however, closed storm drain system may be needed under the ditch such that only SR 70 runoff being contributed to the pond.
    - All three alternatives are located at the east end of the basin due to topography.

        - FDOT Drainage inquired about the outfall locations of the alternatives. HNTB indicated that these closed basin ponds should be discharging to the nearest isolated depression, but will verify after the meeting.
    - Basin 1203
        - An open basin within an impaired WBID.
        - Alternative 1 consists of SMF 1203A (dry pond) and SMF 1203D (dry pond), which both are located north of SR 70 and east of the rail track. SMF 1203D is the remanent space due to the proposed Old SR 8 realignment.
        - Alternative 2 consists of SMF 1203B (dry pond) and SMF 1203D (dry pond). SMF 1203B is located north of SR 70 and 1,150-feet east of the rail track.
        - Alternative 3 consists of SMF 1203C (dry pond) and SMF 1203D (dry pond). SMF 1203C is located south of SR 70 and 600-feet east of the rail track.
    - Basin 1202
        - An open basin within an impaired WBID.
        - Alternative 1 consists of SMF 1202A (dry pond) north of SR 70 and 1,450-feet west of rail track.
        - Alternative 2 consists of SMF 1202B (dry pond) 3,700-feet north of SR 70 near Lake Placid. This was the regional alternative in the previous PD&E. This alternative requires a lengthy storm drain conveyance along Worley Rd.
        - Alternative 3 consists of SMF 1202C (dry pond) at NW corner of SR 70 and Worley Rd.
        - All three alternatives have likely involvement with FGT.
        - FDOT Drainage inquired if SMF 1202A is located inside a FWC interested parcel. HNTB indicated that this is not one of the FWC interested parcels, but will verify after the meeting.
- <u>Floodplain Compensation Areas</u>
    - The FEMA FIRMs within Segment 12 are dated November 2015.
    - The initial PD&E Study used the Lake Placid Watershed model (2014) as the best available information, which is depicting more floodplains than the FEMA FIRMs.
    - FIA 1214
        - Floodplains are located along both sides of SR 70 from the rail track to east of Distribution Blvd.
        - Alternative 1 consists of three FPC sites (FPC 1214A, FPC 1214C, and FPC 1214D) due to the shallow groundwater table.
            - FPC 1214A is located in parcel C1837300100AA00000 on the north side of SR 70 and will require an easement.
            - FPC 1214C is located in parcel C053830A0000300000 on the south side of SR 70 and will require an easement in parcel C323730A0000100000.
            - FPC 1214D is located in parcel C1837300100AA00000 and C323730A0000700000 on the north side of SR 70.
        - Alternative 2 consists of three FPC sites (FPC 1214B, FPC 1214C, and FPC 1214D) due to the shallow groundwater table.
            - FPC 1214B is located in parcel C323730A0000600000 on the north side of SR 70.
            - FPC 1214C and FP1214D are the same as Alternative 1.
        - FDOT Drainage is concerned with the size of the compensation area relative to the impact area.

- After inquiring about modeling scope, FDOT Drainage suggested proceeding as a worst-case scenario and allowing Design-Build (D/B) to perform additional ICPR modeling.
- FDOT PM emphasized the needs for right-of-way acquisition.
- FDOT Drainage suggested investigating other solution, such as upsizing pipes across Old SR 8 and R/R to lower the stages in FIA 1214.
- FDOT Drainage acknowledged that modeling will likely be needed for the permit application with SWFWMD.
- HNTB will investigate further.

o FIA 1213
  - Floodplains are located along both sides of SR 70 from 1,600-feet west of the rail track to the rail track.
  - Alternative 1 consists of FPC 1213A, which is located immediately next to SMF 1202A.
  - Alternative 2 consists of FPC 1213B, which is located north of Lake Annie in parcel C18373001013730000.

o FIA 1211
  - Floodplains are located along both sides of SR 70 from west of Nursey Ln to east of Worley Rd. Some of the impacts are located within the Archbold parcel.
  - FPC cannot be placed inside the Archbold property due to the conservation area.
  - Alternative 1 consists of FPC 1211A, which is located in the parcel (C063830A0000100000) immediately west of the Archbold property.
  - Alternative 2 consists of FPC 1213B, which is located north of SR 70 in parcel C313730A0000120000. The FPC will be bermed up and connect to the floodplain on the south side via a culvert.

5. Items not discussed

- Due to the time constraints, these topics were not fully discussed and tabled to the next checkpoint meeting:
  - o Segment 12
    - Stormwater Management
      - Basin 1201
    - Floodplain Compensation Areas
      - FIA 1201
      - FIA 1203
      - FIA 1205
      - FIA 1206
      - FIA 1208
  - o Segment 13
    - Seepage slope floodplain

MEETING MINUTES

Project Name
SR 70 Segments 12-14

Date of Meeting
March 7, 2025

FPID(s)
414506-3, 414506-4, 414506-5

Location
D1 HQ, Microsoft Teams

Purpose of Meeting
Coordination of ROW, Parcels, Alternate Viability, Access Conveyance Requirements, and Assessment of Aesthetic, Social, Cultural, and Environmental Impacts of Each Alternate. Discuss preliminary impacts, costs and recommended alternatives.

Time
9:30 AM – 11:00 AM

Attendees:

- **FDOT – Brent Setchell, Joe Lauk (PGA), Ryan Molloy**
- **HNTB – Angela Shepard, Braeden Johnson, Ed Ponce, John Burton, John Fowler, Matt Dockins, Nic Leon, Sam Chiu**

Agenda & Notes

1. Introductions & Agenda

- The primary focus of this meeting was to review pond siting progress (especially for the alternatives that were not covered in the previous meeting), estimated impacts and costs. Some preliminary recommended alternatives were discussed and alternative approaches, such as acquisition of flood rights were identified for several floodplain compensation areas.

2. Segment 14

- LDCA is anticipated 04/2025 and re-evaluation is scheduled to be completed 12/2025.
- The Stormwater Management Facility (SMF) alternatives for the three drainage basins (three cross drains) are generally consistent with the 2023 PD&E. The updated evaluation and recommendations will incorporate most recent data collection, estimated impacts, and estimated construction costs.
    - Stormwater Management Alternative 1 (Linear Ponds)
        - Positioned within the 60-ft minimum horizontal offset, between travel lanes and adjacent canal hazards, along both sides of SR 70. The linear ponds extend throughout entire Segment 14 limits.
        - Due to profile gradient and driveway locations, multiple cells are anticipated for each of the three basins.
        - Basin 1: 16 cells
        - Basin 2: 30 cells
        - Basin 3: 19 cells

- Stormwater Management Alternative 2 (Offsite Wet Detention Ponds) (Preliminary Recommended Alternative)
  - Ponds are positioned adjacent to, and outfall into the agricultural canals along SR 70. Easements are required for access and conveyance from roadway into ponds, which will cross beneath the bottom of canal and pond outfalls back to the canals.
- Stormwater Management Alternative 3 (Regional Pond)
  - Alternative to be relocated and redefined from a facility where project runoff is collected and conveyed into, to a facility that diverts a portion of the existing north-south canal that is connected to the C-41. The objective of the redefined alternative is to meet water quantity and water quality requirements through increased detention of the canal (at Node N-0630). The land use swap for water quality may still be required.
    - Potential utility involvement with FGT
- C-41 Control Structure for both SMF and FPC:
  - The evaluation of a new alternative was requested to consider meeting the project's water quantity, water quality, and floodplain compensation needs (through reduction of peak tailwater stages) by the creation of a new control structure within the C-41 canal, owned and maintained by SFWMD, just north of the SR 70 bridge. This alternative would need to be validated that it does not introduce any adverse upstream impacts. It was noted some of the adjacent properties are conservation land with planned wetland restoration activities that may tolerate an increase in tailwater.
- Floodplain Compensation (FPC):
  - Zone A Floodplains present in majority/middle of Segment 14 limits. Modeling is the approach to define required compensation. Updates to 2023 PD&E model have confirmed that identified FPC sites (total 109 ac-ft) are not able to alleviate stage increases within the watershed caused by the estimated 128 ac-ft storage loss due to the proposed roadway.
  - Canal relocation, existing and future ownership is also a factor.
  - A recommended alternative is not yet determined, but the FPC Alternatives were redefined in this meeting to the following:
    - 1. FPC siting approach that combines all sites identified into a single alternative, with aim to avoid any stage increases within the watershed. In this alternative, the relocated canal would be restored to existing conditions.
    - 2. Flood rights acquisition approach that provides no proposed storage in addition to the SMF sites. The relocated canal would be restored to existing conditions, and the locations where resulting 100-year stages now encroach where previously did not would be mapped and sent to FDOT ROW for estimated flood rights cost.
    - 3. Flood rights acquisition approach that relocates the south canal to more stable and maintainable front and back slopes (1:3) and a wider channel bottom to reduce stage increases. Locations where resulting 100-year stages now encroach were previously did not would be mapped and sent to FDOT ROW for estimate flood rights cost. This alternative would include additional ROW and maintenance costs for FDOT ownership of the relocated south canal.

3. Segment 13

- All the site-specific preliminary geotechnical data was received recently.
- Some SHGWT comes back higher, and those alternatives are undergoing modification.

4. Segment 12

- Due to the time constraints in the previous meeting, some basins and floodplain impact areas (FIAs) were not discussed.
- LDCA has been shifted to beyond 06/28/2026. The pond siting is using the new water quality criteria.
- Stormwater Management
    - Basin 1201
        - An open basin within an impaired WBID and is contributing to the Placid Lakes Highlands OFW.
        - This basin is located directly adjacent to the conservation area.
        - Alternative 1 consists of SMF 1201A and SMF 1201D.
            - SMF 1201A is an offsite pond located south of SR 70 in parcel C013829A0000500000, immediately west of the FWC parcel. This SMF is a wet pond based on the preliminary geotechnical data.
            - In order to meet the 95% nutrient removal criteria, onsite linear ponds are needed for pre-treatment as SMF 1201D.
            - FDOT Drainage noted that a potential closed storm drain may be needed to cross the wildlife crossing bridge.
        - Alternative 2 consists of SMF 1201B and SMF 1201E.
            - SMF 1201B is an offsite pond located south of SR 70 in parcel C063830A0000100000, immediately east of the FWC parcel. This SMF is a wet pond based on the preliminary geotechnical data.
            - In order to meet the 95% nutrient removal criteria, onsite linear ponds are needed for pre-treatment as SMF 1201E.
            - FDOT Drainage noted that a potential closed storm drain may be needed to cross the wildlife crossing bridge.
        - Alternative 3 consists of SMF 1201C.
            - SMF 1201C includes onsite linear ponds within the proposed roadway ROW.
            - SMF 1201C more cells than SMF 1201D and SMF 1201E, but is taking advantage of the wide roadway ditches due to FPL.
            - FDOT Drainage noted that this option is favorable (pending cost estimate) due the adjacent conservation areas.
        - Linear ponds and base clearance water elevation (BCWE)
            - FDOT Drainage Manual requires the BCWE be set at the weir when there are linear ponds. Lower elevation may be used at special cases.
            - Currently, the roadway profile is based on geotechnical data, biological indicator, and stain lines. The potential linear pond weirs have not been accounted.
            - HNTB inquired if FDOT will allow the use of the SHGWT to set the BCWE in the area with linear ponds (especially in the area with non HSG Type A soils). If it is not permitted, the cost of additional roadway embankment and mainline ROW would be needed to accommodate the linear ponds.
            - FDOT Drainage will need an email on this potential criteria deviation.

- Basin 1202
  - An open basin within an impaired WBID.
  - The site-specific preliminary geotechnical data shows a lower SHGWT than original estimate. SMF sizes reduction may be possible.
  - Alternative 1 consists of SMF 1202A (dry pond) north of SR 70 and 1,450-feet west of rail track.
  - Alternative 2 consists of SMF 1202B (dry pond) 3,700-feet north of SR 70 near Lake Placid. This was the regional alternative in the previous PD&E. This alternative requires a lengthy storm drain conveyance along Worley Rd.
  - Alternative 3 consists of SMF 1202C (dry pond) at NW corner of SR 70 and Worley Rd.
  - FDOT Drainage noted that all three ponds are located in the same parcel (C18373001015000000).
    - HNTB noted that the constraints of the conservation area to the west and wetland to the east.
  - As a follow-up to the previous meeting, HNTB confirmed that this is not one of the FWC interested parcels.
- Basin 1203
  - An open basin within an impaired WBID.
  - The site-specific preliminary geotechnical data shows a higher SHGWT than original estimate.
  - Alternative 1 consists of SMF 1203A (wet pond) and SMF 1203D (wet pond), which both are located north of SR 70 and east of the rail track. SMF 1203D is the remanent space due to the proposed Old SR 8 realignment.
    - In order to meet the 95% nutrient removal criteria, onsite linear ponds are needed for pre-treatment as SMF 1203E.
  - Alternative 2 consists of SMF 1203B (wet pond) and SMF 1203D (wet pond). SMF 1203B is located north of SR 70 and 1,150-feet east of the rail track.
    - In order to meet the 95% nutrient removal criteria, onsite linear ponds are needed for pre-treatment as SMF 1203E.
  - Alternative 3 consists of SMF 1203C (wet pond) and SMF 1203D (wet pond). SMF 1203C is located south of SR 70 and 600-feet east of the rail track.
    - In order to meet the 95% nutrient removal criteria, onsite linear ponds are needed for pre-treatment as SMF 1203E.
  - FDOT Drainage inquired about the outfall locations. HNTB clarified the linear ponds would discharge into the offsite ponds, which then discharge northwestern direction.
- Basin 1204
  - A closed basin within an impaired WBID.
  - The alternatives were modified to avoid the downstream depression.
  - Alternative 1 consists of SMF 1204A (dry pond) north of SR 70 and 1,000-feet west of US 27. The site-specific preliminary geotechnical data shows a percolation rate.
  - Alternative 2 consists of SMF 1204B (dry pond) at NW corner of SR 70 and US 27.
    - FDOT Drainage inquired how the roadway runoff will reach this pond.
    - HNTB clarified that it will likely be conveyed with a closed storm drain systema long US 27.
  - Alternative 3 consists of SMF 1204C (dry pond) west of US 27 and 650-feet south of SR 70. The preliminary assessment has encroachment into the depression. A standalone FPC could be added next to the SMF.

- Floodplain Compensation Areas
  - Floodplain Impact Area (FIA) 1201
    - Floodplain is located along the north side of SR 70 from east of Placid Lakes Blvd to west of Park Land Dr.
    - This FIA is located directly within the conservation area.
    - Alternative 1 consists of FPC 1201A at the southeast corner of SR 70 and Placid Lakes Blvd. The FPC will be bermed up and connect to the floodplain on the north side via a culvert.
    - Alternative 2 consists of obtaining flood right within the conservation area. Additional modeling would likely be necessary for this alternative.
      - FDOT Drainage concurred to explore this further. FDOT Drainage will coordinate with FDOT OEM.
  - FIA 1203
    - Floodplains are located along both side of SR 70 from east of Placid Lakes Blvd to 1,440-feet west of Placid View Dr.
    - The northern FIA is located directly within the conservation area.
    - The 100-year peak stage in the southern floodplain is nearly 2-feet higher than the northern floodplain.
    - Alternative 1 consists of FPC 1203A for the southern impacts, and floodplain modeling for the northern impacts.
      - FPC 1203A is located along the southern edge of parcel C023829A0000200000.
    - Alternative 2 consists of FPC 1203B for the southern impacts, and floodplain modeling for the northern impacts.
      - FPC 1203B is located along the private access road within parcel C023829A0000200000.
    - FDOT Drainage and HNTB discussed Alternative 3 on improving the culverts under SR 70 to lower the southern floodplain to offset the encroachment, and obtaining flood right within the conservation area.
      - FDOT Drainage concurred to explore this further. FDOT Drainage will coordinate with FDOT OEM.
  - FIA 1205
    - Floodplains are located along both side of SR 70 west of Placid View Dr.
    - The northern FIA is located directly within the conservation area.
    - Alternative 1 consists of FPC 1205A, which is located west of the channel within parcel C023829A0000800000.
    - Alternative 2 consists of FPC 1205B, which is located east of the channel within parcel C023829A0000800000.
    - FDOT Drainage and HNTB discussed Alternative 3 on improving the culverts under SR 70 to lower the southern floodplain to offset the encroachment, and obtaining flood right within the conservation area.
      - FDOT Drainage concurred to explore this further. FDOT Drainage will coordinate with FDOT OEM.
  - FIA 1206
    - Floodplains are located along both side of SR 70 east of Placid View Dr.
    - The northern FIA is located directly within the conservation area.
    - Alternative 1 consists of FPC 1206A, which is located west of the channel within parcel C013829A0000600000.

- Alternative 2 consists of FPC 1206B, which is located east of the channel within parcel C013829A0000600000.
- FDOT Drainage and HNTB discussed Alternative 3 on improving the culverts under SR 70 to lower the southern floodplain to offset the encroachment, and obtaining flood right within the conservation area.
    - FDOT Drainage concurred to explore this further. FDOT Drainage will coordinate with FDOT OEM.

o FIA 1208

- Floodplains are located along both side of SR 70 from 2,350-feet west of Monroe St to 500-feet west of Monroe St.
- The northern FIA is located directly within the conservation area.
- The portion of the southern FIA is located directly within the FWC parcel.
- Alternative 1 consists of FPC 1208A, which is located south of SR 70 in parcel C013829A0000500000, immediately west of the FWC parcel. The FPC will connect to the floodplain via a culvert.
- Alternative 2 consists of FPC 1208B, which is located south of SR 70 in parcel C063830A0000100000, immediately east of the FWC parcel. The FPC will connect to the floodplain via a culvert.
- FDOT Drainage and HNTB discussed Alternative 3 on improving the culverts under SR 70 to lower the southern floodplain to offset the encroachment, and obtaining flood right within the conservation area.
    - FDOT Drainage concurred to explore this further. FDOT Drainage will coordinate with FDOT OEM.

o FIA 1214

- HNTB evaluated about upsizing the culvert under Old SR 8 and R/R to lower the stages in FIA 1214. The preliminary results show that upsizing the culverts do not affect the flood stages at SR 70.
- HNTB suggested modeling the compensation areas to reduce the FPC footprint. FDOT Drainage concurred.

HNTB Corporation

MEETING MINUTES

Project Name
SR 70 Segments 12-14

Date of Meeting
July 28, 2025

FPID(s)
414506-3, 414506-4, 414506-5

Location
D1 HQ, Microsoft Teams

Purpose of Meeting
PSR Checkpoint 3 discussion prior to Final PSR submittal.

Time
10:00 AM – 12:00 PM

Attendees:

- **FDOT – Joe Lauk (PGA), Brent Setchell, Ryan Molloy, Brook Feagle**
- **HNTB – Gordon Mullen, John Burton, John Fowler, Brett Hensley, Nic Leon, Sam Chiu, Braeden Johnson, Sammy Huey, Angela Shepard, Eugene Garrick, Jackson Glover**

Agenda & Notes

1. Introductions & Agenda

- Confirm final pond siting recommendations.

2. Segment 12

- Stormwater Management
  - Basin 1201
    - An open basin within an impaired WBID and is contributing to the Placid Lakes Highlands OFW.
    - Alternative 1 consists of 14 dry linear pond cells (SMF 1201D) and one offsite wet pond (SMF 1201A).
    - Alternative 2 consists of 14 dry linear pond cells (SMF 1201E) and one offsite wet pond (SMF 1201B).
    - Alternative 3 consists of 43 dry linear pond cells (SMF 1201C).
    - Alternative 3 is the preferred alternative.
      - Discussed the preferred alternative assuming BCWE can be based on the 24-hour stage of the linear pond (instead of the weir elevation), which will require a deviation approval from District Drainage.
      - Discussed the preferred alternative may require a lower base clearance requirement based on the site specific geotech data and ICPR modeling. Profile adjustment is not feasible due to the conservation land to the north.
  - Basin 1202
    - An open basin within an impaired WBID.
    - Three alternatives have been identified. Each alternative consists of an offsite dry pond.
    - Alternative 1 (SMF 1202A) is the preferred alternative.
      - The pond's outfall is through the FPC site to the east.
  - Basin 1203

Commented [BS1]: Are the soils well draining? Is there an adjacent low area or canal that draws down the water table? Can the water "seep" thru the outside berm to lower lying areas?

HNTB Corporation
The HNTB Companies

hntb.com

- An open basin within an impaired WBID.
- Three alternatives have been identified. Due to the realignment of Old SR 8, the site SMF 1203D is common to all three alternatives.
- Alternative 1 consists of one dry linear pond cell (SMF 1203E) and two offsite wet ponds (SMF 1203A and SMF 1203D).
- Alternative 2 consists of three dry linear pond cells (SMF 1203F) and two offsite wet ponds (SMF 1203B and SMF 1203D).
- Alternative 3 consists of two dry linear pond cells (SMF 1203F) and two offsite wet ponds (SMF 1203C and SMF 1203D).
- Alternative 1 is the preferred alternative.
  - FDOT PM inquired about the existing access from Old SR 8 to the nursery. HNTB to verify with FDOT R/W if the impact cost include cost to cure.

- Basin 1204
  - A closed basin within an impaired WBID.
  - Three alternatives have been identified. Each alternative consists of an offsite dry pond.
  - Alternative 1 (SMF 1204A) is the preferred alternative.

- <u>Floodplain Compensation Areas</u>
  - Floodplain Impact Area (FIA) 1201, FIA 1203, FIA 1205, and FIA 1206
    - One offsite alternative has been identified for FIA 1201.
    - Two offsite alternatives have been identified for FIA 1203, FIA 1205, and FIA 1206.
    - Flood right alternative was discussed in previous meeting.
      - Per the email from FWC on July 1, 2025, FWC is open to flood right alternative in lieu of any additional acreage of FPC in the Wildlife Management Area (WMA).
      - After the Pond Siting stage, HNTB will need expand scopes to model the mean annual through the 100-year storm event to show the stage increases. The model also should show the recovery timeframe.
      - HNTB to update graphic of the anticipated flood right for FDOT Drainage to continue coordination with FWC.
      - HNTB to obtain R/W or easement cost from FDOT R/W for the flood rights.
      - Flood right alternative should have no impacts to environmental, archaeological, cultural and contamination.
    - FDOT PM indicated that the non-preferred offsite alternative does not need to be shown in the NRE, CRAS, and CSER.
  - FIA 1208
    - Two offsite alternatives have been identified.
    - Flood right alternative was discussed in previous meeting, but was not in the list to FWC.
    - HNTB to provide graphic of the anticipated flood right for FDOT Drainage to coordination with FWC.
  - FIA 1211
    - Two offsite alternatives have been identified.
    - Alternative 2 (FPC 1211B) is the preferred alternative.
      - This alternative will likely require a submerged pipe connecting the FPC to the impacted area to the south.
      - It is a smaller site when compared to FPC 1211A (which has a higher ground elevation); therefore, it yields a lower R/W cost.

  - FIA 1213

HNTB Corporation
The HNTB Companies
Infrastructure Solutions

201 N. Franklin Street
Suite 1200
Tampa, FL 33602

Telephone (813) 402-4150
hntb.com

- Two offsite alternatives have been identified.
- Alternative 1 (FPC 1213A) is the preferred alternative.
    - This alternative has less wetland impacts.

o FIA 1214

- Alternative 1 consists for FPC 1214A, FPC 1214C, and FPC 1214D.
- Alternative 2 consists for FPC 1214B, FPC 1214C, and FPC 1214D.
    - FDOT Drainage inquired if the southern parcel can be full take, expand FPC 1214C, and reduce FPC 1214B/FPC 1214D.
    - HNTB indicated that the remaining areas are already floodplains.

Commented [BS2]: Could a new FPC be located in the same location as SMF 1203B to potentially avoid the other two impact areas?

2. Segment 13

- Stormwater Management
    - Basin 1301
        - A closed basin within an impaired WBID.
        - Three alternatives have been identified. Each alternative consists of an offsite dry pond.
        - It was noted that SMF Alternative 3 (SMF 1301C) occupies the same space as FPC Alternative 1 (FPC 1301A); therefore, SMF and FPC should be considered together.
        - SMF Alternative 1 (SMF 1301A) and FPC Alternative 1 (FPC 1301A) are the preferred alternative.
    - Basin 1302
        - A closed basin within an impaired WBID.
        - Three alternatives have been identified. Each alternative consists of an offsite dry pond.
        - Alternative 2 was the initial site from the previous PD&E study, but it has high risk on species.
        - Alternative 3 (SMF 1302C) is the preferred alternative.
    - Basin 1303
        - A closed basin within an impaired WBID.
        - Three alternatives have been identified.
        - Alternatives 1 and 2 consist of an offsite dry pond (SMF 1303A and SMF 1303B, respectively). Alternative 3 consist of four dry linear pond cells (SMF 1303D and SMF 1303E) and one offsite wet pond (SMF 1303C).
        - Alternative 1 (SMF 1303A) is the preferred alternative.
- Floodplain Compensation Areas
    - FIA 1301
        - Two offsite alternatives have been identified.
        - It was noted that SMF Alternative 3 (SMF 1301C) occupies the same space as FPC Alternative 1 (FPC 1301A); therefore, SMF and FPC should be considered together.
        - SMF Alternative 1 (SMF 1301A) and FPC Alternative 1 (FPC 1301A) are the preferred alternative.
    - FIA 1303
        - One offsite alternative has been identified given the impact to FIA 1303 is an isolated depression.
        - FDOT Drainage inquired if the FPC provides account for the potential impact to the internal agricultural access for the property owner. HNTB to verify with FDOT R/W if the impact cost include cost to cure.
        - Alternative 1 (FPC 1303A) is the preferred alternative.
    - FIA 1306

HNTB Corporation
The HNTB Companies
Infrastructure Solutions

201 N. Franklin Street
Suite 1200
Tampa, FL 33602

Telephone (813) 402-4150
hntb.com

- One offsite alternative has been identified given the impact to FIA 1306 is an isolated depression.
- Alternative 1 (FPC 1306A) is the preferred alternative.

  - FIA 1309
    - Two offsite alternatives have been identified.
    - Alternative 1 consists of diverting the offsite runoff from the high-fill area into the roadway R/W via an offsite swale. A retaining wall will also be needed along the back of shared use path to reduce impacts.
    - Alternative 2 consists of an offsite alternative south of the FIA.
    - FDOT Drainage inquired if the residential parcel considered per previous meetings. HNTB indicated that the roadway R/W has not confirmed the need to whole take the residential property. However, a third alternative can be considered given the proposed roadway R/W is near the residential building.

- <u>ERC Comment</u>
  - The following ERC comment was received for the Draft PSR: *The proposed project will require substantial fill for the proposed typical section for that segment beyond the "ridge" and into the flat "plains" on the eastern portion of the project. Please estimate the embankment fill that may be necessary within the "plains" and the borrow that will become available with the preferred SMF sites and FPC sites along the ridge. This could help determine whether it would be cost effective to provide cup-for-cup FPC or reduce or eliminate FPC by further detailed analysis.*
    - HNTB indicated that PSR is currently based on volumetric basis, not modeling. HNTB also indicated that the corridor program is likely require imported fill.
    - FDOT Drainage concurred to stay with the current methodology, especially due to the depressions along the project.

<u>4. Segment 14</u>

- The three stormwater alternatives (A, B, and C) matrix and kmzs were reviewed with FDOT.
  - Water quality requirements for Segment 14 are grandfathered to old rules.
  - Stormwater design is being governed by SFWMD maximum allowable discharge criteria for the Harney Pond Canal (C-41), which was previously confirmed in the pre-application meeting in 2024. Alternatives A and B meet this criteria through use of minimum bleed-down device sizes. Although the regional pond provides a significant decrease in peak discharge from pre to post, the control structure for Alternative C does not meet the maximum CFM.
  - FDOT concurred that Wet Detention (Alt B) remains the recommended alternative.
  - No significant changes were made to the recommended wet detention alterative SMFs from draft to final, but slight adjustments were incorporated based on new survey information.
  - FDOT had concerns regarding maintenance access due to the anticipated depth of pipes into the SMF ponds. If selected as the preferred alternative, the conveyance system placement (currently shown along the pond berm) will be optimized for maintenance accessibility during the design phase.
  - SMF Alt A high costs include the additional earthwork required to both raise the roadway profile and expand right of way to meet dry pond recovery and base clearance criteria.
- The three FPC alternatives matrix and kmzs were reviewed with FDOT.
  - Alternative 1 is the combination of all FPC sites. Alternative 2 only replaces the existing canal in kind, and alternative 3 improves the relocated canal on the south side of SR 70 with additional storage and side drain capacity. All alternatives require some amount of flood rights.

HNTB Corporation
The HNTB Companies
Infrastructure Solutions

201 N. Franklin Street
Suite 1200
Tampa, FL 33602

Telephone (813) 402-4150
hntb.com

- FDOT concurred that Alternative 3 remains the preferred alternative. Although it is not the lowest cost option, it provides an overall flood reduction benefit versus Alternative 2.
- Most of the flood stage increases are within existing FEMA Zone A areas and within agricultural land uses. However, there is one residential structure near SMF 1 which is positioned near an increase in peak stage. There is also an active caracara nest adjacent to the east side of SMF 1.
- Smaller storm events, such as mean annual, 5-year, 10-year, and 25-year will be run in the design phase to help inform flood rights agreements. The duration of peak stages and recovery may also be an important factor.
- Potential approaches to flood rights acquisition were discussed.
  - Joe~~s~~ asked how flood rights easements would be established?
    - Elevation based, curvilinear feature would be difficult to establish "metes and bounds"
    - Given the large extent of the flood shapes, Brent mentioned that the survey of all locations would not be reasonable.
    - An alternative could be a conservative placement, such as defining a safe upland line, sufficiently above the peak stage.
    - Another alternative could be to include the whole parcel and noting "all lands lying below elevation xx within said parcel."
  - Flood rights agreements would need to establish the right to increase the peak stage within areas and preclude property owners from filling in the floodplain otherwise their property may be subject to further increases in peak stages.

5. Action items:

- Segment 12
  - HNTB to verify with FDOT R/W if the impact cost include cost to cure for the access driveway for SMF 1203A.
  - HNTB to provide update graphic of the anticipated flood right for FDOT Drainage to continue coordination with FWC for FIA 1201, FIA 1203, FIA 1205, FIA 1206, and FIA 1208.
  - HNTB to provide recovery timeframe after the modeling for FIA 1201, FIA 1203, FIA 1205, FIA 1206, and FIA 1208.
- Segment 13
  - HNTB to verify with FDOT R/W if the impact cost include cost to cure for internal agricultural access for FPC 1301A.
  - HNTB to add a third alternative at the residential parcel for FIA 1309.
- Segment 14
  - Obtain additional information on the finished floor elevation of the structure adjacent to SMF 1.
  - Verify model conditions near SMF 1 to confirm flood rights requirements and proximity to the existing structure. Verify if additional improvements, outside of the current alternatives, are necessary to incorporate into the PSR.

Subject: RE: SR 70 Follow Up

Hi Thu,
Thanks for following up. We just resolved this last week.
Long story short, the Wildlife Management Area (WMA) administrators and staff are willing to accept the additional floodplain impacts.
After speaking to Brent Setchell, I provided my understanding to the WMA folks that these impacts are very intermittent and short duration, after only major rainfall events. However, they specifically asked that I relay again the pristine and exceptional qualities of Lake Wales Ridge and the biodiversity there. They considered asking for mitigation but agreed that it would be hard to quantify impacts and this result is preferable to any additional acreage of floodplain comp ponds on WMA property.

Regards,

Josh Cucinella
Florida Fish and Wildlife Conservation Commission

[EXTERNAL SENDER] Use Caution opening links or attachments

Josh,

I was on a call with D1 earlier today and they wanted me to ask if you (and others at FWC) have had the opportunity to discuss floodplain impacts. This was in the second part of Katasha's email on April 11th and I have included it in this email as an easy reference – but you could also scroll down through the email chain as well. Please see below. And if you have already discussed or corresponded with Katasha on this subject, could you please forward that information. She's on leave for the next couple of weeks and I am just trying to be helpful to the district.

Sincerely,

Thu Clark

"The new question relates to floodplain impacts. Here is some initial information about this request:

Attached is the preliminary amount of floodplain encroachment that we would be requesting from FWC. The yellow highlighted rows are amounts required for each floodplain encroachment area.

Floodplain	Depth	Additional Encroachment Area
FPC 1201	0.46'	1.051 acres
FPC 1203	0.44'	5.477 acres
FPC 1205	0.14'	0.341 acres
FPC 1206	0.17'	0.173 acres
Total		7.042 acres

This encroachment will likely only occur during very large storm events (likely exceeding a 25-year event). The inundation period for the additional areas is dependent on the positive outfall, soils, and subsequent rain events, but will likely be less than 72 hours. Allowing this encroachment would prevent FDOT from having to do total takes for floodplain compensation (potentially on LWREA lands) and scraping down areas to replace the lost volume. Below is a very rough example of what would be proposed. During a 100-year storm event water would normally "pond" in the green areas. If compensation is not provided elsewhere to expand the floodplain, the blue area would become inundated

Thanks, and look forward to hearing from you when you have a moment to digest this information."

Subject: RE: SR 70 Follow Up

Katasha,
I apologize for the delay in responding here. I suppose the meeting times are no longer valid. Below are some time blocks that Will, Larame, Jimmy, and I are available:
5/15: 9-10
5/16: 9-10:30
5/30: 3-5
6/9: 4-5
6/11: 1-2

If we leave out Jimmy, these times open up. Though, if we want to include a discussion of the consent letter, having him there will be valuable:

5/19: 9-11
5/20: 3-5
5/22: 2-5

To the question about the parcel outlined in blue, WMA management do want to use that parcel as part of the acreage for ARC mitigation. They were hopeful appropriate fencing could still be installed, but wanted the list of potential replacement lands to remain the same as previously sent over.

I've reviewed your comments in the consent letter and think everything looks reasonable. I've made a few changes and will work with Larame on the rest of the items. Ideally, we could have response for everything by the time we meet.

Regards,

Josh Cucinella

Subject: SR 70 Follow Up

[EXTERNAL SENDER] Use Caution opening links or attachments
Josh,

Hello and happy Friday. Touching base on SR 70 as I believe we have a couple of outstanding items, and we now have one new question. Details are below, but we would like to see if we can schedule a brief meeting to discuss this with you and the team. We are available these dates and times:

4/29 from 1:30 to 2:30
4/30 from 2:30 to 4:00
5/6 from 10:00 to 11:00
5/7 from 2:30 to 4:00
5/8 from 2:00 to 3:00

The first outstanding item is that we owe you all our comments on the draft consent letter. Those are attached.

The second outstanding item is our question which relates to the proposed parcel (outlined in blue) for mitigation adjacent to the wildlife crossing and whether that could be reconsidered as a viable option as ARC replacement lands.

The new question relates to floodplain impacts. Here is some initial information about this request:

Attached is the preliminary amount of floodplain encroachment that we would be requesting from FWC. The yellow highlighted rows are amounts required for each floodplain encroachment area.

Floodplain	Depth	Additional Encroachment Area
FPC 1201	0.46’	1.051 acres
FPC 1203	0.44’	5.477 acres
FPC 1205	0.14’	0.341 acres
FPC 1206	0.17’	0.173 acres
Total		7.042 acres

This encroachment will likely only occur during very large storm events (likely exceeding a 25-year event). The inundation period for the additional areas is dependent on the positive outfall, soils, and subsequent rain events, but will likely be less than 72 hours. Allowing this encroachment would prevent FDOT from having to do total takes for floodplain compensation (potentially on LWREA lands) and scraping down areas to replace the lost volume. Below is a very rough example of what would be proposed. During a 100-year storm event water would normally “pond” in the green areas. If compensation is not provided elsewhere to expand the floodplain, the blue area would become inundated

Thanks, and look forward to hearing from you when you have a moment to digest this information.

Respectfully,

Katasha Cornwell
Interim Director, Office of Environmental Management
Florida Department of Transportation

Analysis Type: Specified Removal Efficiency

BMP Types:

- Catchment 1 - (Transportation (Pond) West) Wet Detention with Littoral Shelf
- Catchment 2 - (Urban (Industrial) East) None
- Catchment 3 - (Wetland West) None
- Catchment 4 - (Undeveloped (Upland Forests) East) None
- Catchment 5 - (Agricultural West) None
- Catchment 6 - (Transportation (Pond) East) Multiple BMP
- Catchment 7 - (Transportation (DD - West)) None
- Catchment 8 - (Transportation (DD - East)) None

Routing Summary

- Catchment 1 Routed to Outlet
- Catchment 2 Routed to Outlet
- Catchment 3 Routed to Outlet
- Catchment 4 Routed to Outlet
- Catchment 5 Routed to Outlet
- Catchment 6 Routed to Catchment 1
- Catchment 7 Routed to Outlet
- Catchment 8 Routed to Outlet

Based on % removal values to the nearest percent

Total nitrogen target removal met? **Yes**

Total phosphorus target removal met? **Yes**

Summary Report

Nitrogen

Surface Water Discharge		
Total N pre load	21.21 kg/yr	
Total N post load	41.58 kg/yr	
Target N load reduction	80 %	
Target N discharge load	8.32 kg/yr	
Percent N load reduction	80 %	
Provided N discharge load	8.12 kg/yr	17.9 lb/yr
Provided N load removed	33.46 kg/yr	73.77 lb/yr

Phosphorus

Surface Water Discharge		
Total P pre load	2.762 kg/yr	
Total P post load	5.415 kg/yr	
Target P load reduction	80 %	
Target P discharge load	1.083 kg/yr	
Percent P load reduction	92 %	
Provided P discharge load	.407 kg/yr	.9 lb/yr
Provided P load removed	5.008 kg/yr	11.043 lb/yr

[1]Used permitted design high water elevation instead of SHWL to calculate required FPC volume

[2]Impacts will be evaluated via modeling or flood rights. No floodplain compensation area proposed.

[3]Floodplain impacts deminimus based on roadway cross section. Compensation, if needed, can be performed within right-of-way

Notes:

[1] Top Elevation based on peak stage of SWFWMD Gauge 716776.

[2] Bottom Elevation based on SWFWMD Gauge 716778.

[3] FPC 1208B provides floodplain compensation exclusively for Alternative 2. Therefore total required FPC for ALternative#2 is 1.37 acre-ft.

[4] Bottom Elevation based on average of the site specific SHGWT and seasonal high water level at the downstream cross drain (112.30 ft).

[5] Bottom Elevation based on average of the site specific SHGWT and average SHGWT at the downstream floodplain (112.20 ft).

Runoff and Encroachment Volume Comparison

These calculations were used to determine where modeling could be performed to demonstrate no rise in flood elevation in lieu of floodplain compensation sites.
