MEMORANDUM

Date: May 31, 2023

To: Michael Coleman, RS&H

From: Domingo Noriega and Tanzina Atique, AECOM

Project: Master Plan Study I-4 (SR 400) from West of SR 570 (Polk Parkway) to West of US 27 Interchange (Phase 2) Financial Project Identification (FPID) Nos.: 442512-1; 442512-2

Subject: Revised Draft Build Alternatives Traffic Analysis Memo (Phase 2)

Florida Department of Transportation (FDOT) District One has initiated a Master Plan study for Interstate 4 (I-4)(SR 400) in Polk County. The study limits extend from west of SR 570 (Polk Parkway) to west of US 27 interchange, about 27.6 miles in length and traverses the major urban area of Lakeland in Polk County. I-4 supports vital commerce and tourism of the state as it connects employment and population centers, including Tampa, Lakeland, Orlando, and Daytona Beach, within Florida. It is one of few east-west limited access facilities in the central portion of the state along with Florida's Turnpike. I-4 is also a designated state hurricane evacuation route and part of Florida's Strategic Intermodal System (SIS) highway network.

Project Background

I-4 Feasibility Study for Phase 1 was completed in October 2021. The study consists of data collection, traffic analyses and public involvement with a focus on the I-4 mainline. Also, it defines the area of traffic influence, determines the year when interchanges are anticipated to fail, and identifies the locations where improvements are needed. A summary of Build Alternatives evaluated under Phase 1 Feasibility Study is as follows:

- Build Alternative 1 – Add 2 general use lanes (GULs) in each direction
- Build Alternative 2 – Add 2 buffer separated express lanes (ELs) in each direction
- Build Alternative 3 – Add 2 barrier separated express lanes (ELs) in each direction
- Build Alternative 4 – Add 1 GUL and 1 HOV lane in each direction

Note: Buffer/barrier separation does not affect traffic operations, so Alternative 2 and Alternative 3 were analyzed as Alternative 2 at the Feasibility stage. Based on operational and safety analyses as well as public input collected, Build Alternative 1 and 2 were recommended to be evaluated further in the Phase 2.

Phase 2 Feasibility Study

It was established that the primary purpose of Phase 2 of the Feasibility Study was to develop interchange improvements, identify long and short-term capacity needs along the I-4 mainline and managed lanes ***(referred to as Express Lanes herein***), and address capacity deficiencies of segments identified as operating below the Level of Service (LOS) target (LOS D) adopted for this facility as part of the Strategic Intermodal System (SIS) designation. The Memorandum of Agreement (MOA) for Phase 2 has been approved by FDOT District One and the I-4 Master Plan team (attached in **Appendix A**) on October 10, 2022.

Following improvements are assumed for the Phase 2 traffic analysis:

No-Build Alternative

- I-4 interchange improvements at CSX Railroad (bridge replacement)
- SR 33 interchange modification - roundabout
- SR 557 interchange modification – roundabout
- SR 559 interchange ramp terminals – signalized

Build Alternative 1

I-4 mainline widening from six to ten lanes: addition of two General Purpose Lanes (GPLs) on each direction.

Build Alternative 2

I-4 mainline widening from six to ten lanes: addition of two Express/High Occupancy Toll (HOT) lanes on each direction.

The purpose of this Draft Build Alternative Traffic Analysis memorandum is to document the Build Alternatives traffic analysis using the Synchro (signalized intersection), SIDRA (roundabout) and HCS (freeway mainline) software for Design Year 2045 within the study limits. Existing conditions Vissim calibration and future analysis using Vissim model for the I-4 at US 98 and I-4 at North Socrum Road/Lakeland Hills Boulevard interchanges along with adjacent arterial intersections will be submitted in a separate memo. The Facility Enhancement Element memorandum will address long-term improvements for I-4.

1.0 Purpose and Need Statement

The purpose of the I-4 Master Plan is to address deficiencies in operational capacity of I-4 in Polk County, also known as Florida's State Road (SR) 400, from west of SR 570 (Polk Parkway) to west of US 27 interchange in Polk County to accommodate future travel demand projected as a result of population and employment growth along the corridor. I-4 also serves significant freight distribution centers in Polk County. Capacity deficiencies are present under the existing condition and are expected to increase in the future. The goal of this Phase 2 study is to evaluate the potential addition of managed lanes, additional general-use lanes, and develop interchange improvements.

Other goals of the project are to:

- Preserve the operational integrity and regional functionality of I-4 (and, therefore, the regional transportation network) by complementing similar corridor improvements to the east and west
- Enhance emergency evacuation and response times

The need for this project is based on the following criteria:

Capacity/Transportation Demand: The project is anticipated to improve traffic operations on I-4 by increasing capacity and better dispersing traffic (i.e., separating managed lanes traffic from general-use traffic). The traffic dispersal and reduced congestion can decrease vehicle conflicts and, therefore, enhance travel conditions of the corridor. Under the current condition, the queue on the I-4 segments approaching US 27 from the west backs up significantly (about 5 miles) at evening peak hours. I-4 within the project limits currently operates at Level of Service (LOS) C to F, with annual average daily traffic volumes ranging from 74,000 vehicles to 140,000 vehicles per day (source: FDOT Florida Traffic Online 2021). Traffic volumes on the corridor are projected to increase to between 151,800 and 203,400 vehicles per day by 2045 (source: I-4 Master Plan Phase 1 Traffic Projection). If the proposed project improvements do not occur, the operating conditions along the corridor will continue to deteriorate as the traffic increases.

Safety: I-4 serves as part of the emergency evacuation route network designated by the Florida Division of Emergency Management. Also designated as an evacuation facility of Polk County, I-4 is vital in facilitating traffic during emergency evacuation periods as it connects to other major arterials and highways of the state evacuation route network [such as SR 570 (Polk Parkway) and US 27].

The project is anticipated to:

- Improve emergency evacuation capabilities by enhancing connectivity and accessibility to other major arterials designated on the state evacuation route network;
- Increase traffic volumes that can be evacuated during an emergency event, and
- Allow for enhanced emergency access and incident response time due to the ability to maintain operational speeds within the managed lanes.

System Linkage: As part of Florida's SIS highway network, I-4 plays a significant role in facilitating commuter, visitor, and freight traffic within the state. The proposed project improvements are part of a larger, regional set of projects on the interstate system to the west [in Hillsborough, Pinellas, Manatee, Sarasota, Charlotte, Lee, and Collier Counties] where managed lanes, additional general use lanes and auxiliary lanes are being considered to increase the operational capacity of not only I-4 but I-75 and I-275 as well. The intent is for all these project improvements to work together to improve the overall reliability and performance of the interstate system in moving high volumes of goods and people at efficient speeds. It is important to note that managed lanes also create an opportunity for the provision of efficient and reliable transit service. As such, these improvements are critical to enhancing regional mobility. They are also key in preserving the operational integrity and regional functionality of the I-4 corridor.

2.0 Project Limits

This project is located along I-4 from west of SR 570 (Polk Parkway) to west of US 27 interchange. The study area is shown in **Figure 1.**

The study area includes seven existing service interchanges on I-4 and two system interchanges at I-4 and Polk Parkway. The on-and off-ramps and merge/diverge areas for the existing interchanges are encompassed along I-4 and Polk Parkway. The interchanges are listed below:

- I-4 and SR 570 (Polk Parkway) System-to-System Interchange
- I-4 and US 92/SR 546 (West Memorial Boulevard)
- I-4 and SR 539 (Kathleen Road)
- I-4 and US 98/SR 35/SR 700
- I-4 and CR 582 (North Socrum Loop Road)/SR 33 (Lakeland Hills Boulevard)
- I-4 and SR 33 (Lakeland Hills Boulevard/Commonwealth Avenue)
- I-4 and SR 570 (Polk Parkway) System-to-System Interchange
- I-4 and SR 559
- I-4 and SR 557

This section of I-4 consists of a six-lane divided typical section with a maximum posted speed limit of 70 miles per hour. The functional classification of I-4 within the project limits is Urban Principal Arterial – Interstate. Existing right of way along the corridor ranges from approximately 300 feet to 450 feet in width.

3.0 Data Collection

Traffic and Crash Data

Data collection for the study consists of information from the FDOT, local government officials and other sources as available. It includes existing and field collected data. Sources of information include, but not limited to:

- Straight Line Diagrams (SLDs)
- Roadway Characteristic Inventory (RCI) Data
- Florida Geographic Data Library (FGDL) Geographic Information System (GIS) Data
- FDOT Design Standards
- Latest Five-Year Crash History
- Existing Traffic Signal Timings
- Existing AADT counts along mainline and ramps from the FDOT FTO
- Traffic count data, and
- District One Regional Planning Model (D1RPM v 2.0) 2015 Base Year and 2045 Cost Feasible Model

Figure 1. Project Location and Study Area (Sheet 1 of 3)

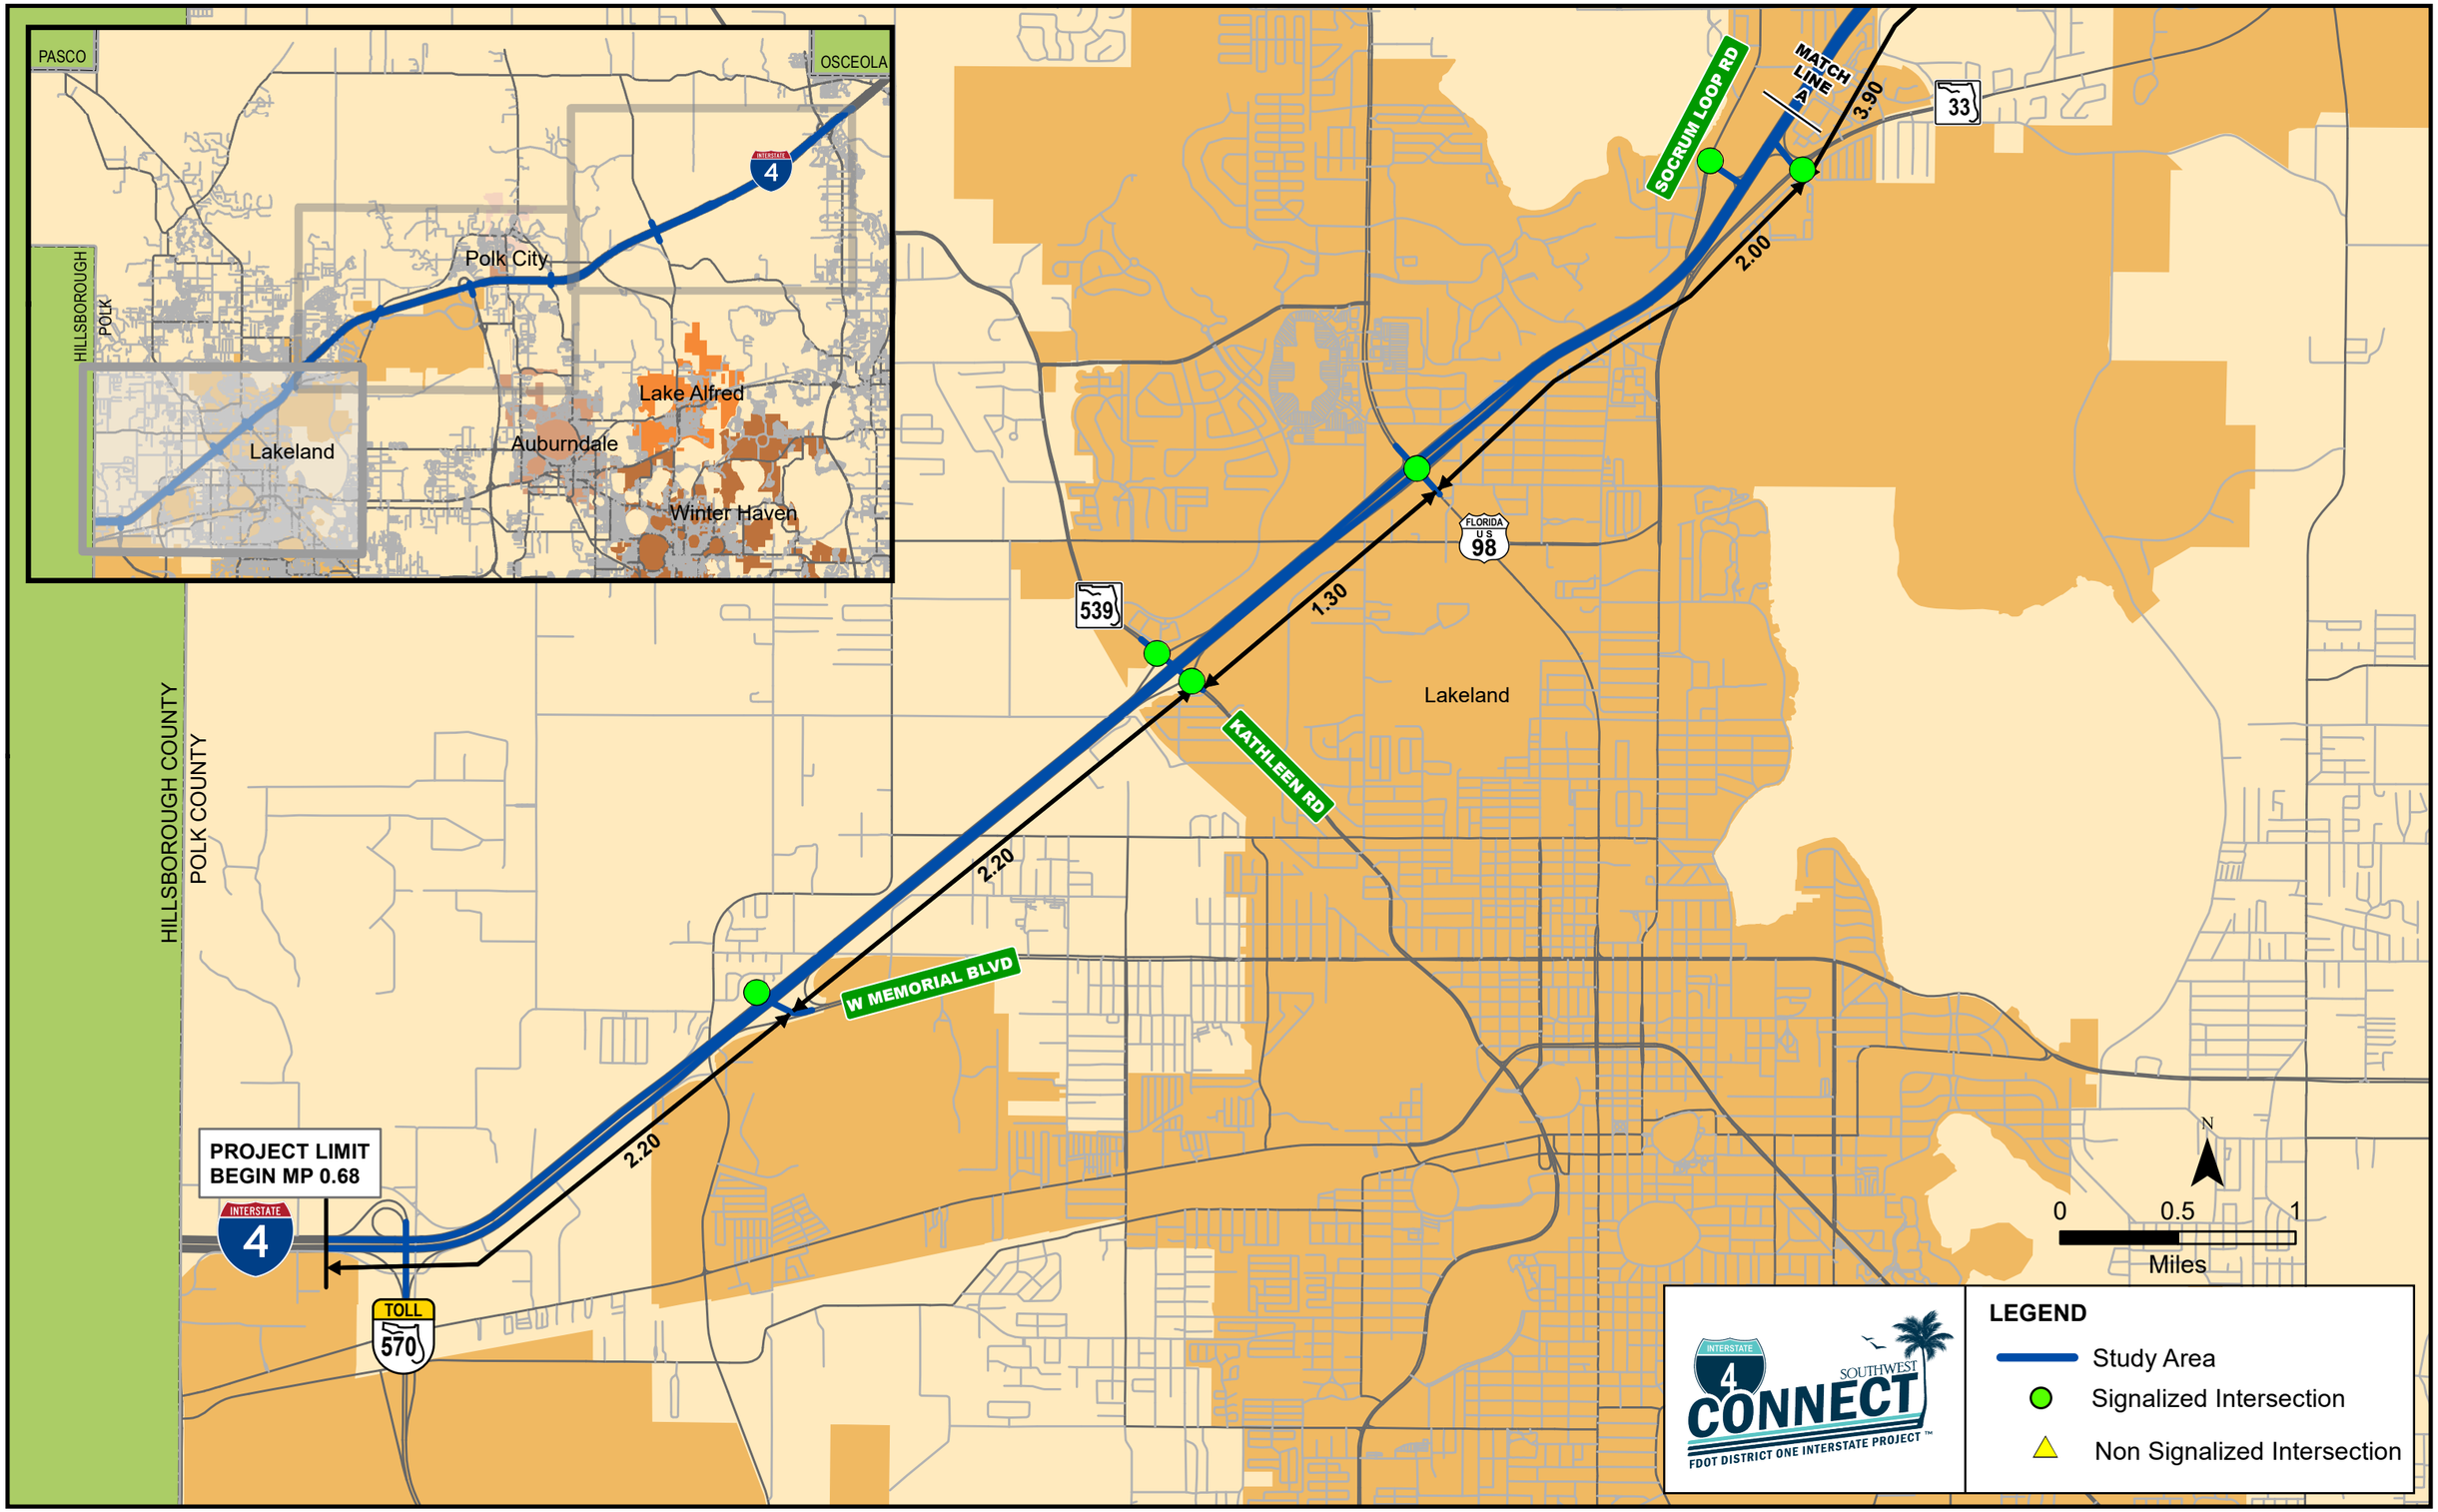

Figure 1. Project Location and Study Area (Sheet 2 of 3)

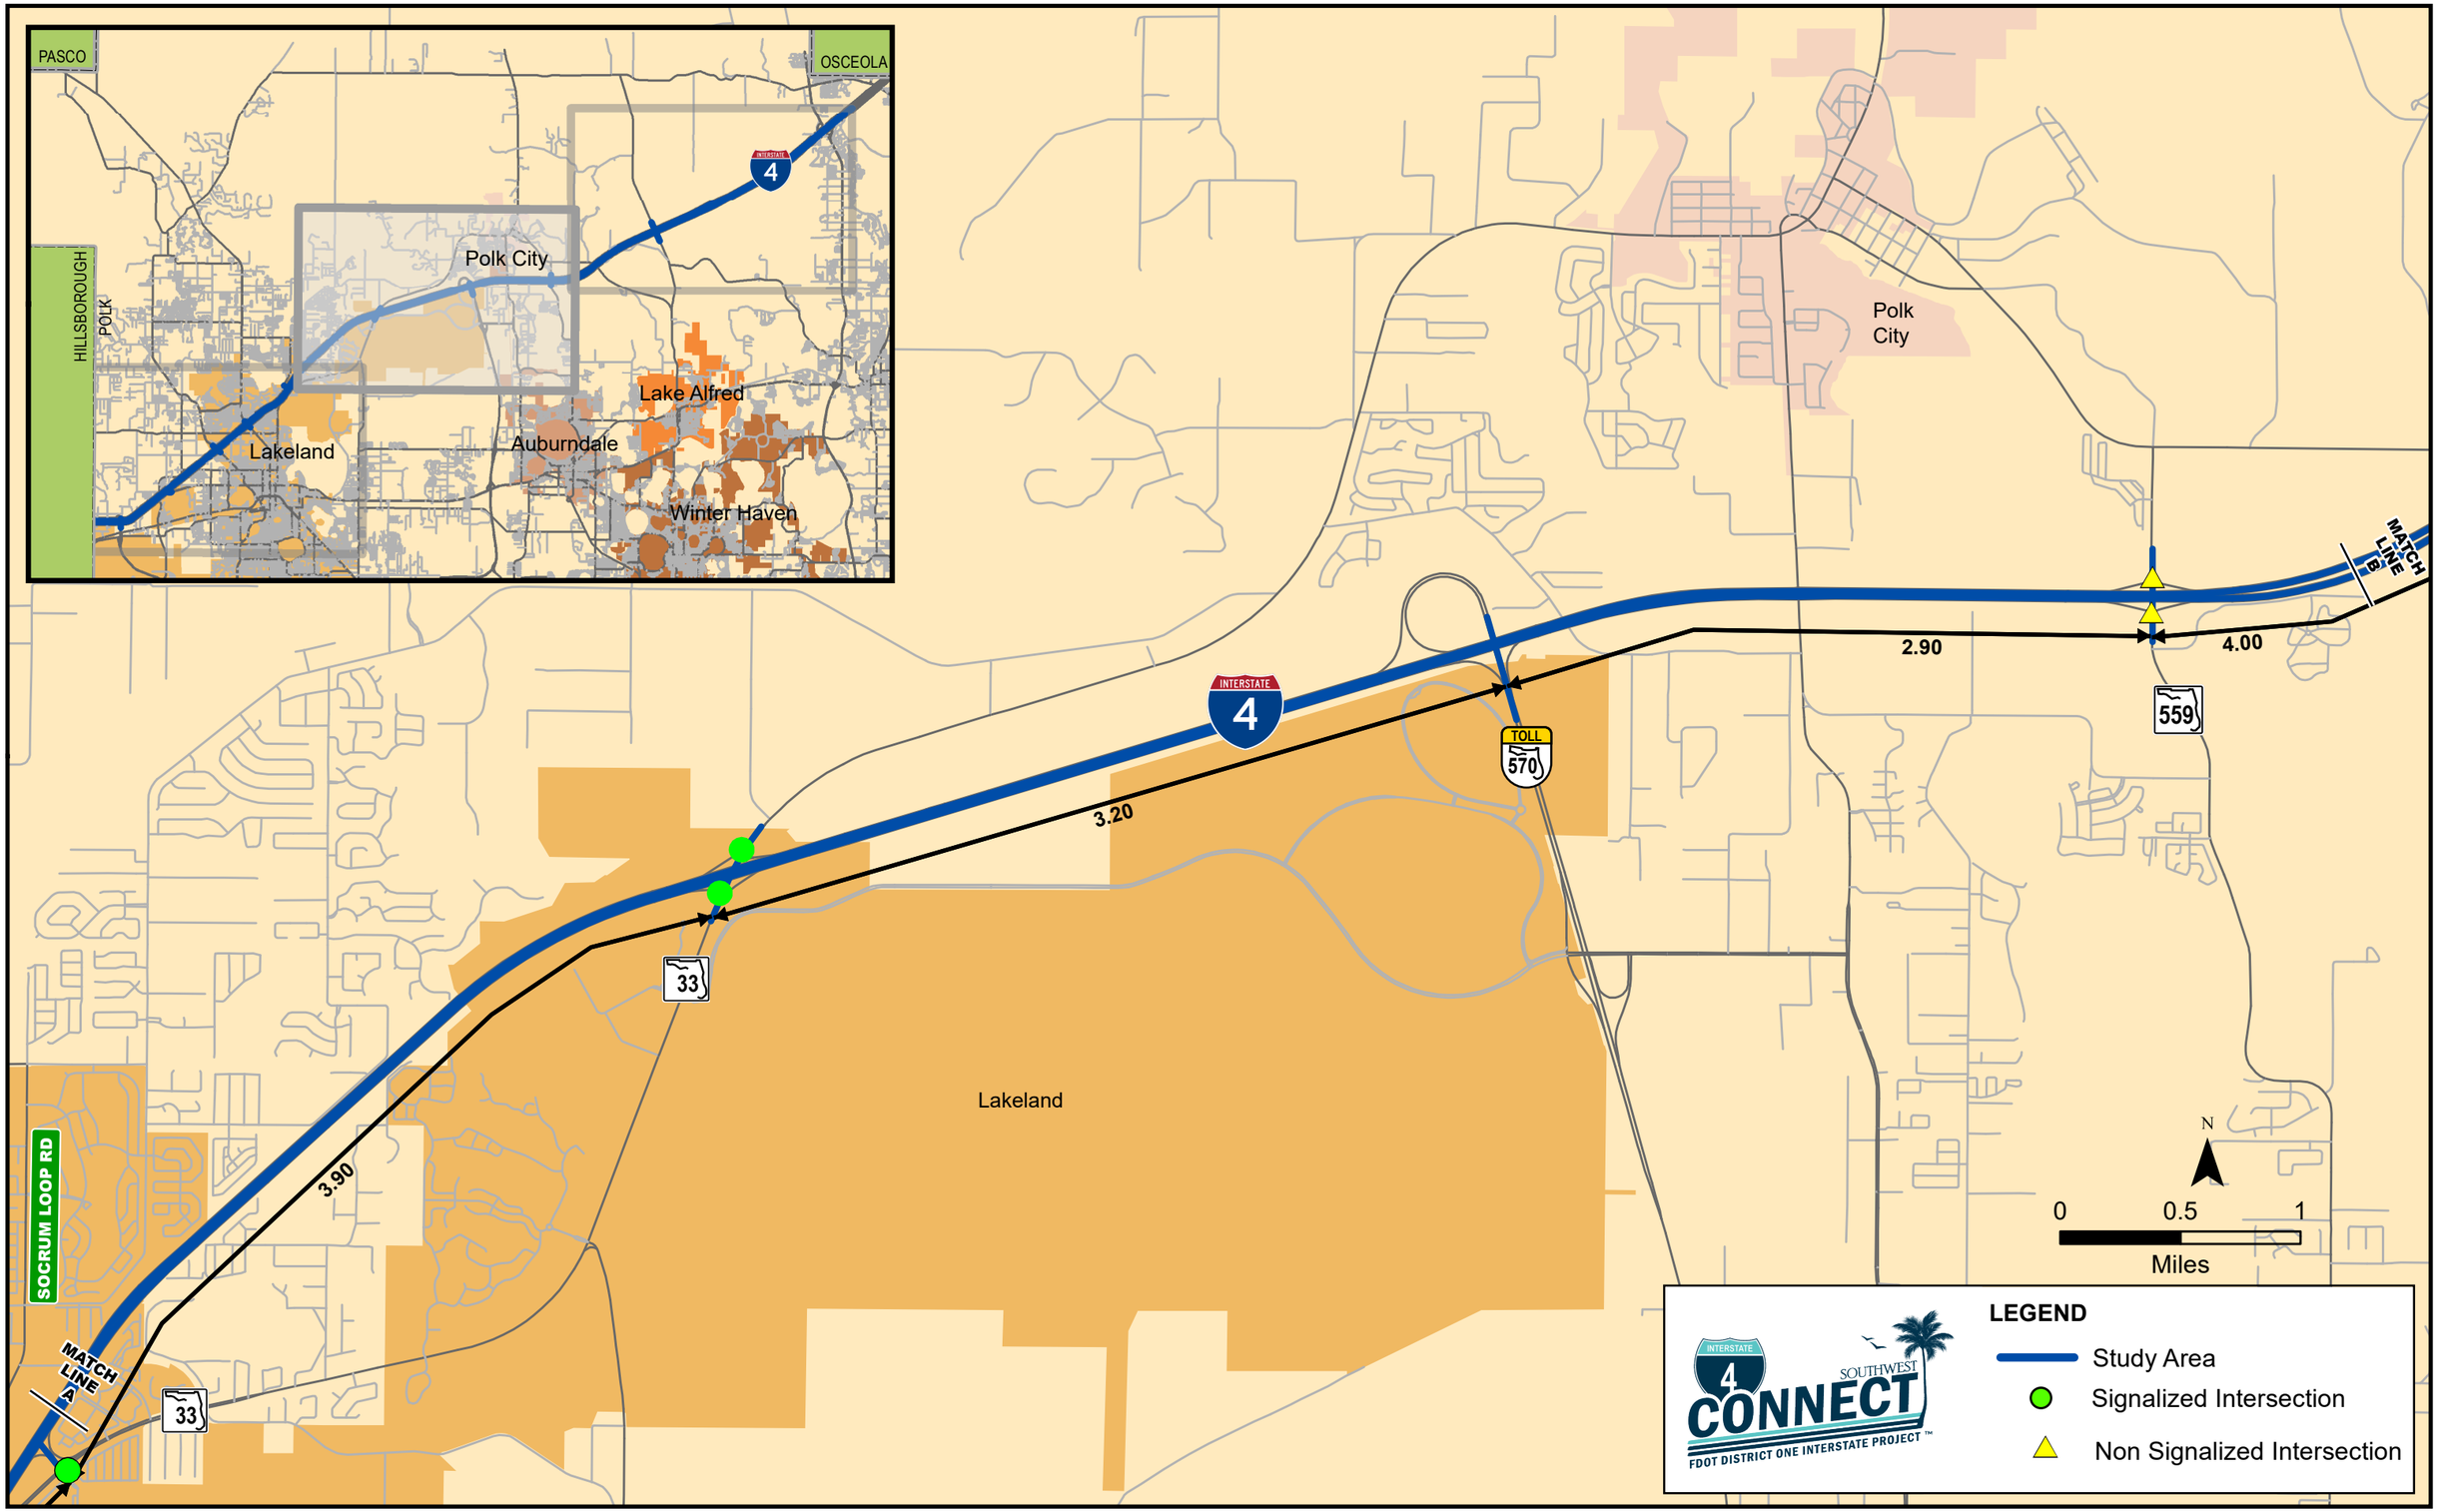

Figure 1. Project Location and Study Area (Sheet 3 of 3)

Based on approved methodology and the scope of service, an assessment of future traffic conditions and year of failure analysis from Phase 1, recent Turning Movement Counts (TMC) were collected at specific locations as discussed below. Other TMCs were considered from Phase 1 traffic analysis.

Traffic Counts

24-hour volume tube counts (bi-directional approach volumes at 15-minute increments with hourly totals) and concurrent 4-hour (two-hour AM and two-hour PM) vehicle turning movement counts (TMC) (at 15-minute increments with hourly totals) for peak periods (7AM to 9 AM and 4PM to 6 PM) were conducted in mid-August 2022 at the following locations (See **Figure 2**):

- US 98 at Lakeland Square Mall (4-hour TMC)
- US 98 at Lakeland Park Center Drive (4-hour TMC)
- US 98 Ramp Terminals (4-hour TMC)
- US 98 at Pyramid Parkway (4-hour TMC)
- US 98 at Griffin Road (4-hour TMC)
- N Socrum Loop Road at Lakeland Park Blvd (4-hour TMC)
- N Socrum Loop Road at Old Combee Road (4-hour TMC)
- Lakeland Hills Blvd. at Melody Lane (4-hour TMC)
- N Socrum Loop/Lakeland Hills Blvd Ramp Terminals (4-hour TMC)
- SR 33 Ramp Terminals (4-hour TMC)
- SR 559 Ramp Terminals (4-hour TMC and including 24-hour volume counts)
- SR 557 Ramp Terminals (4-hour TMC)

Figure 2 Traffic Count Locations (Sheet 1 of 3)

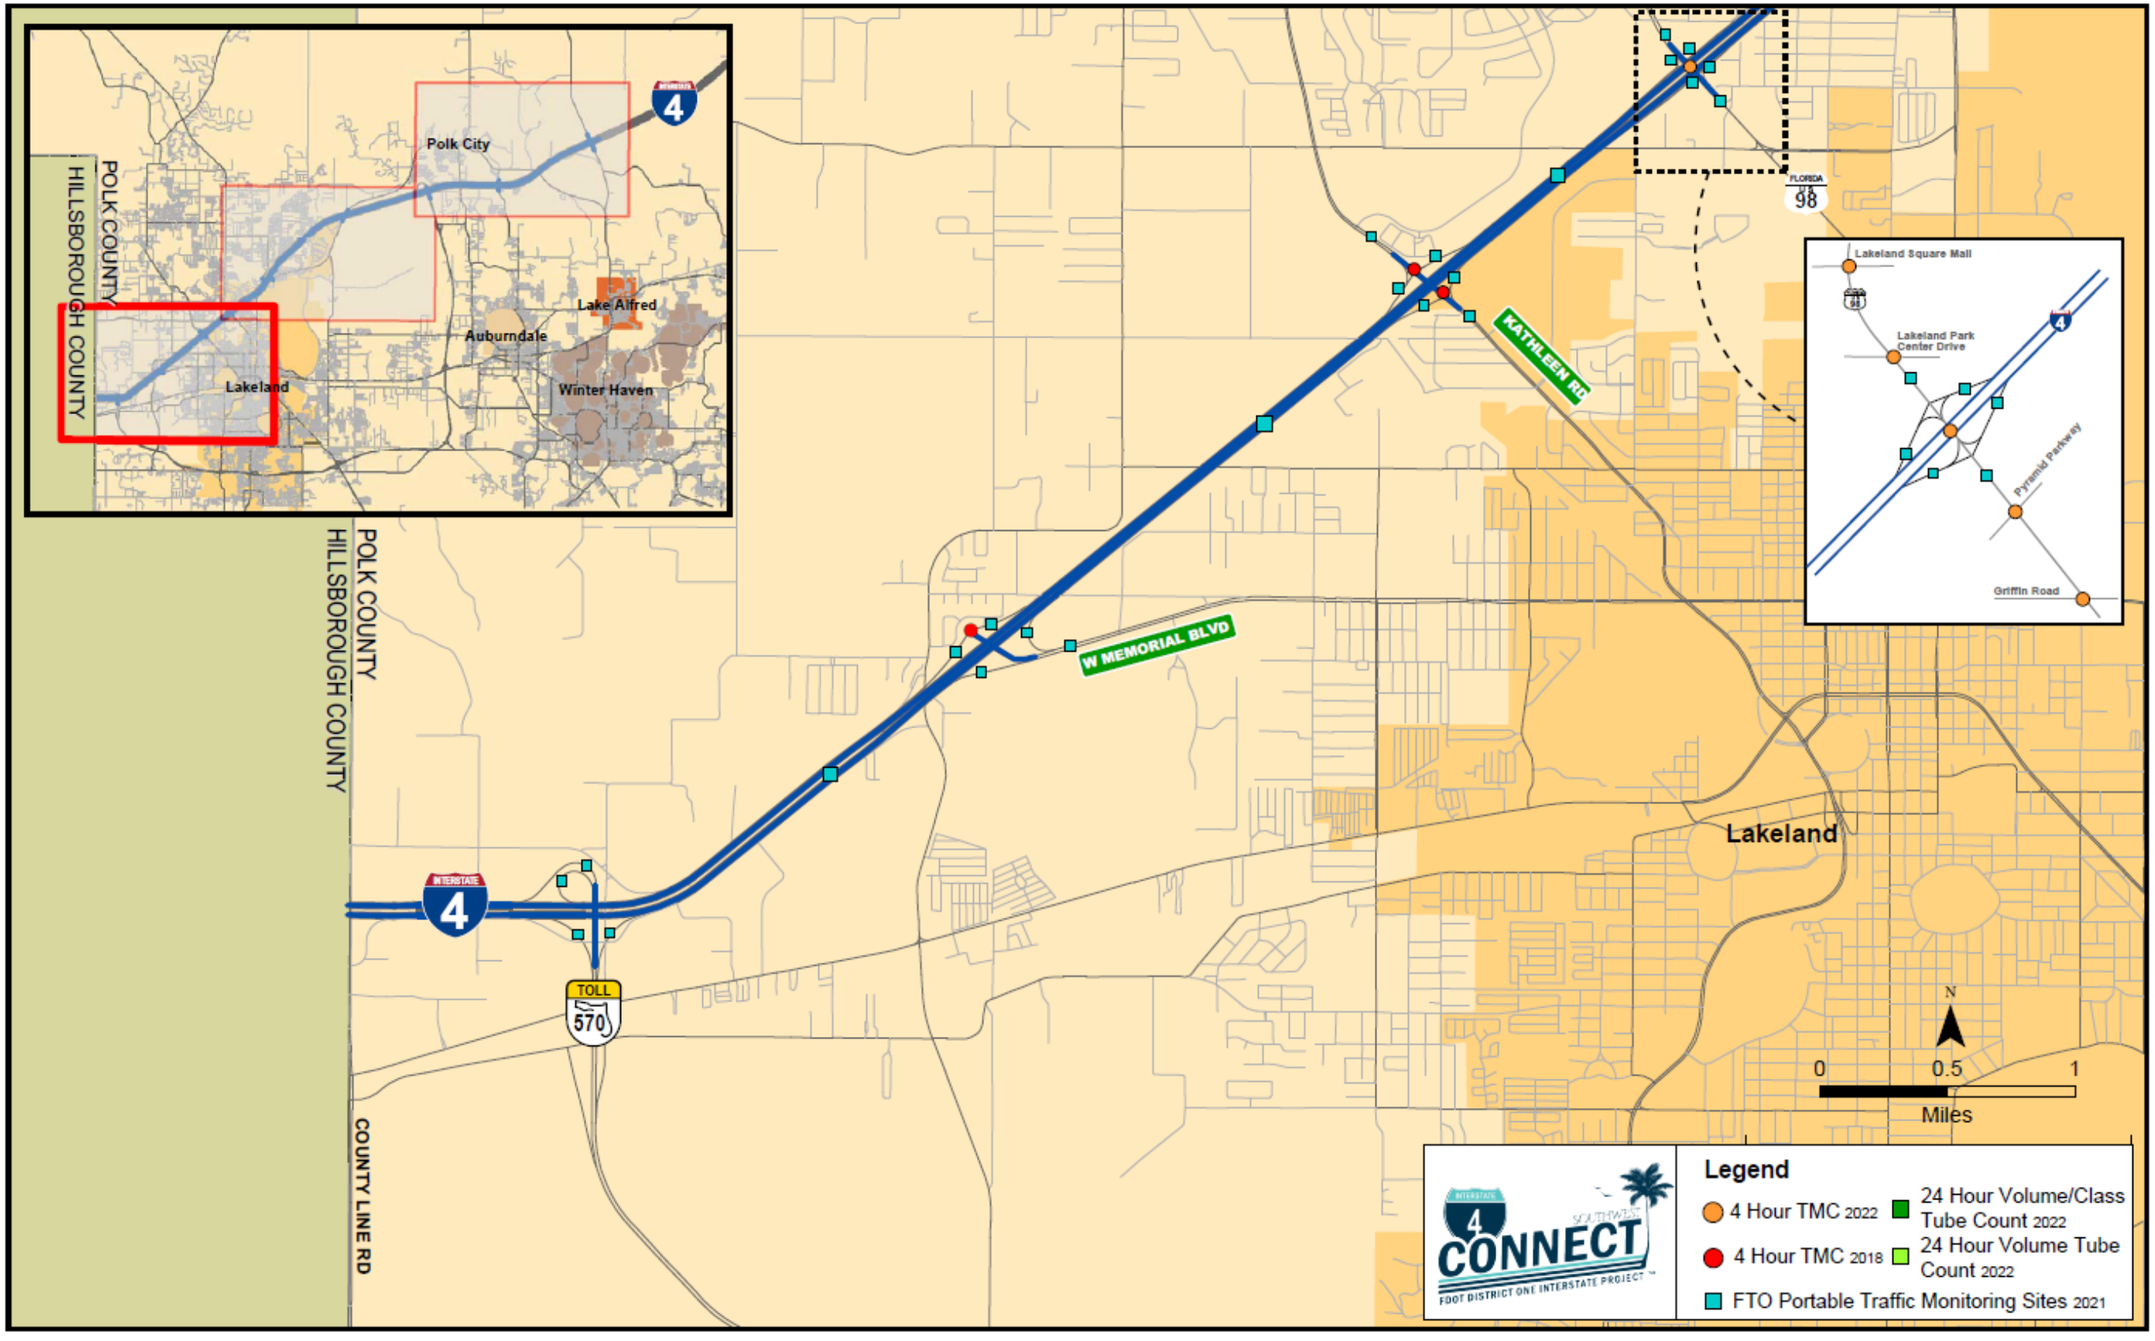

Figure 2 Traffic Count Locations (Sheet 2 of 3)

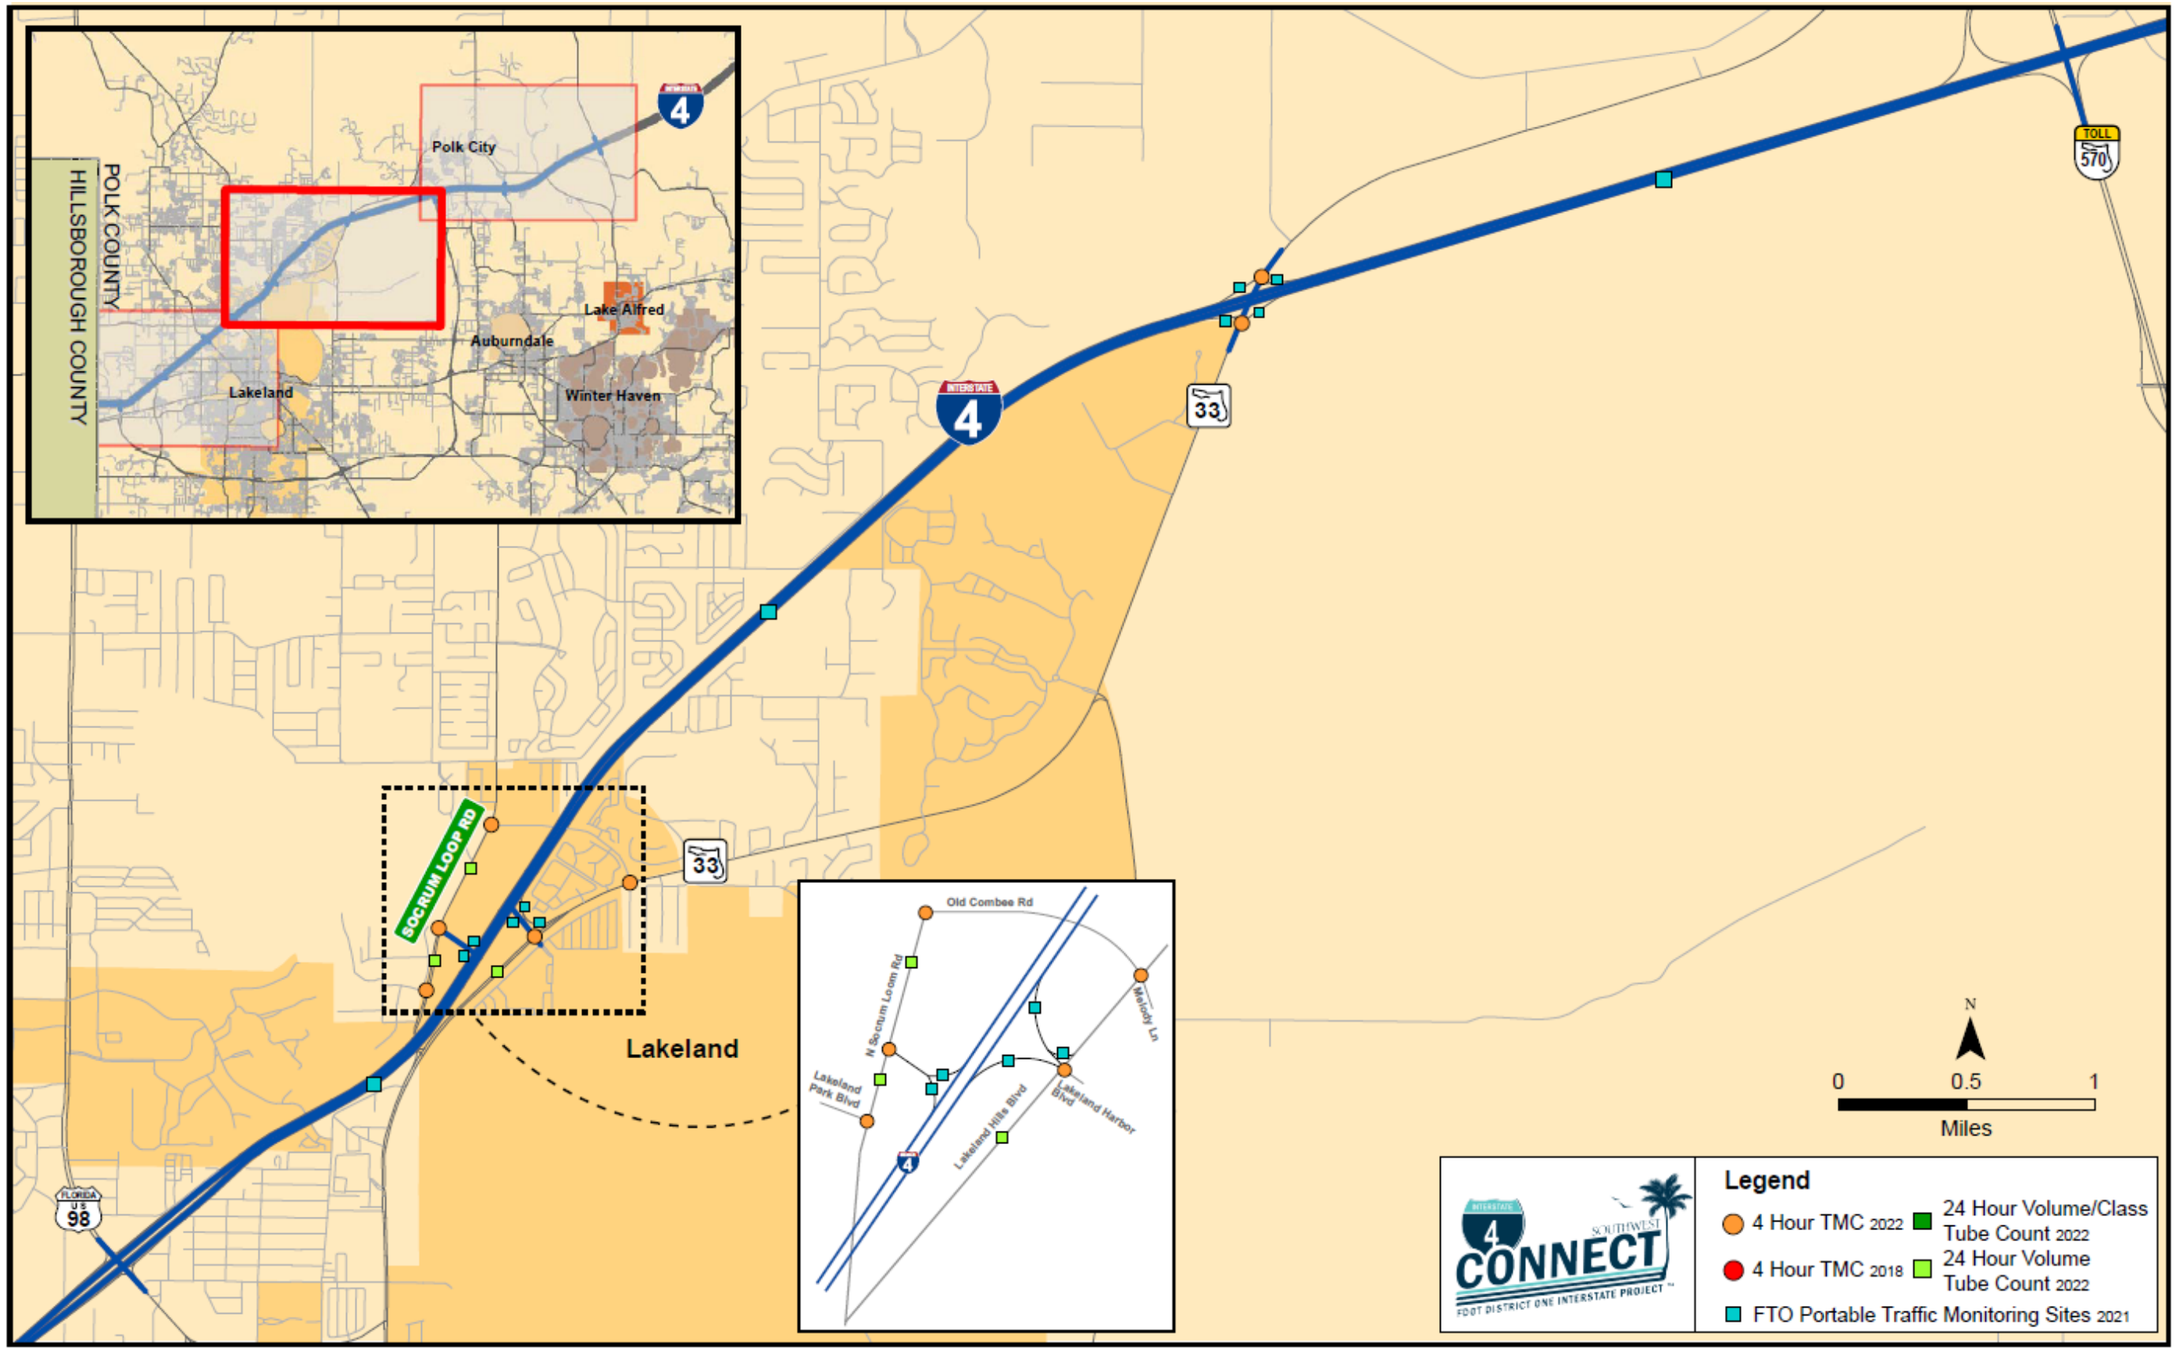

Figure 2 Traffic Count Locations (Sheet 3 of 3)

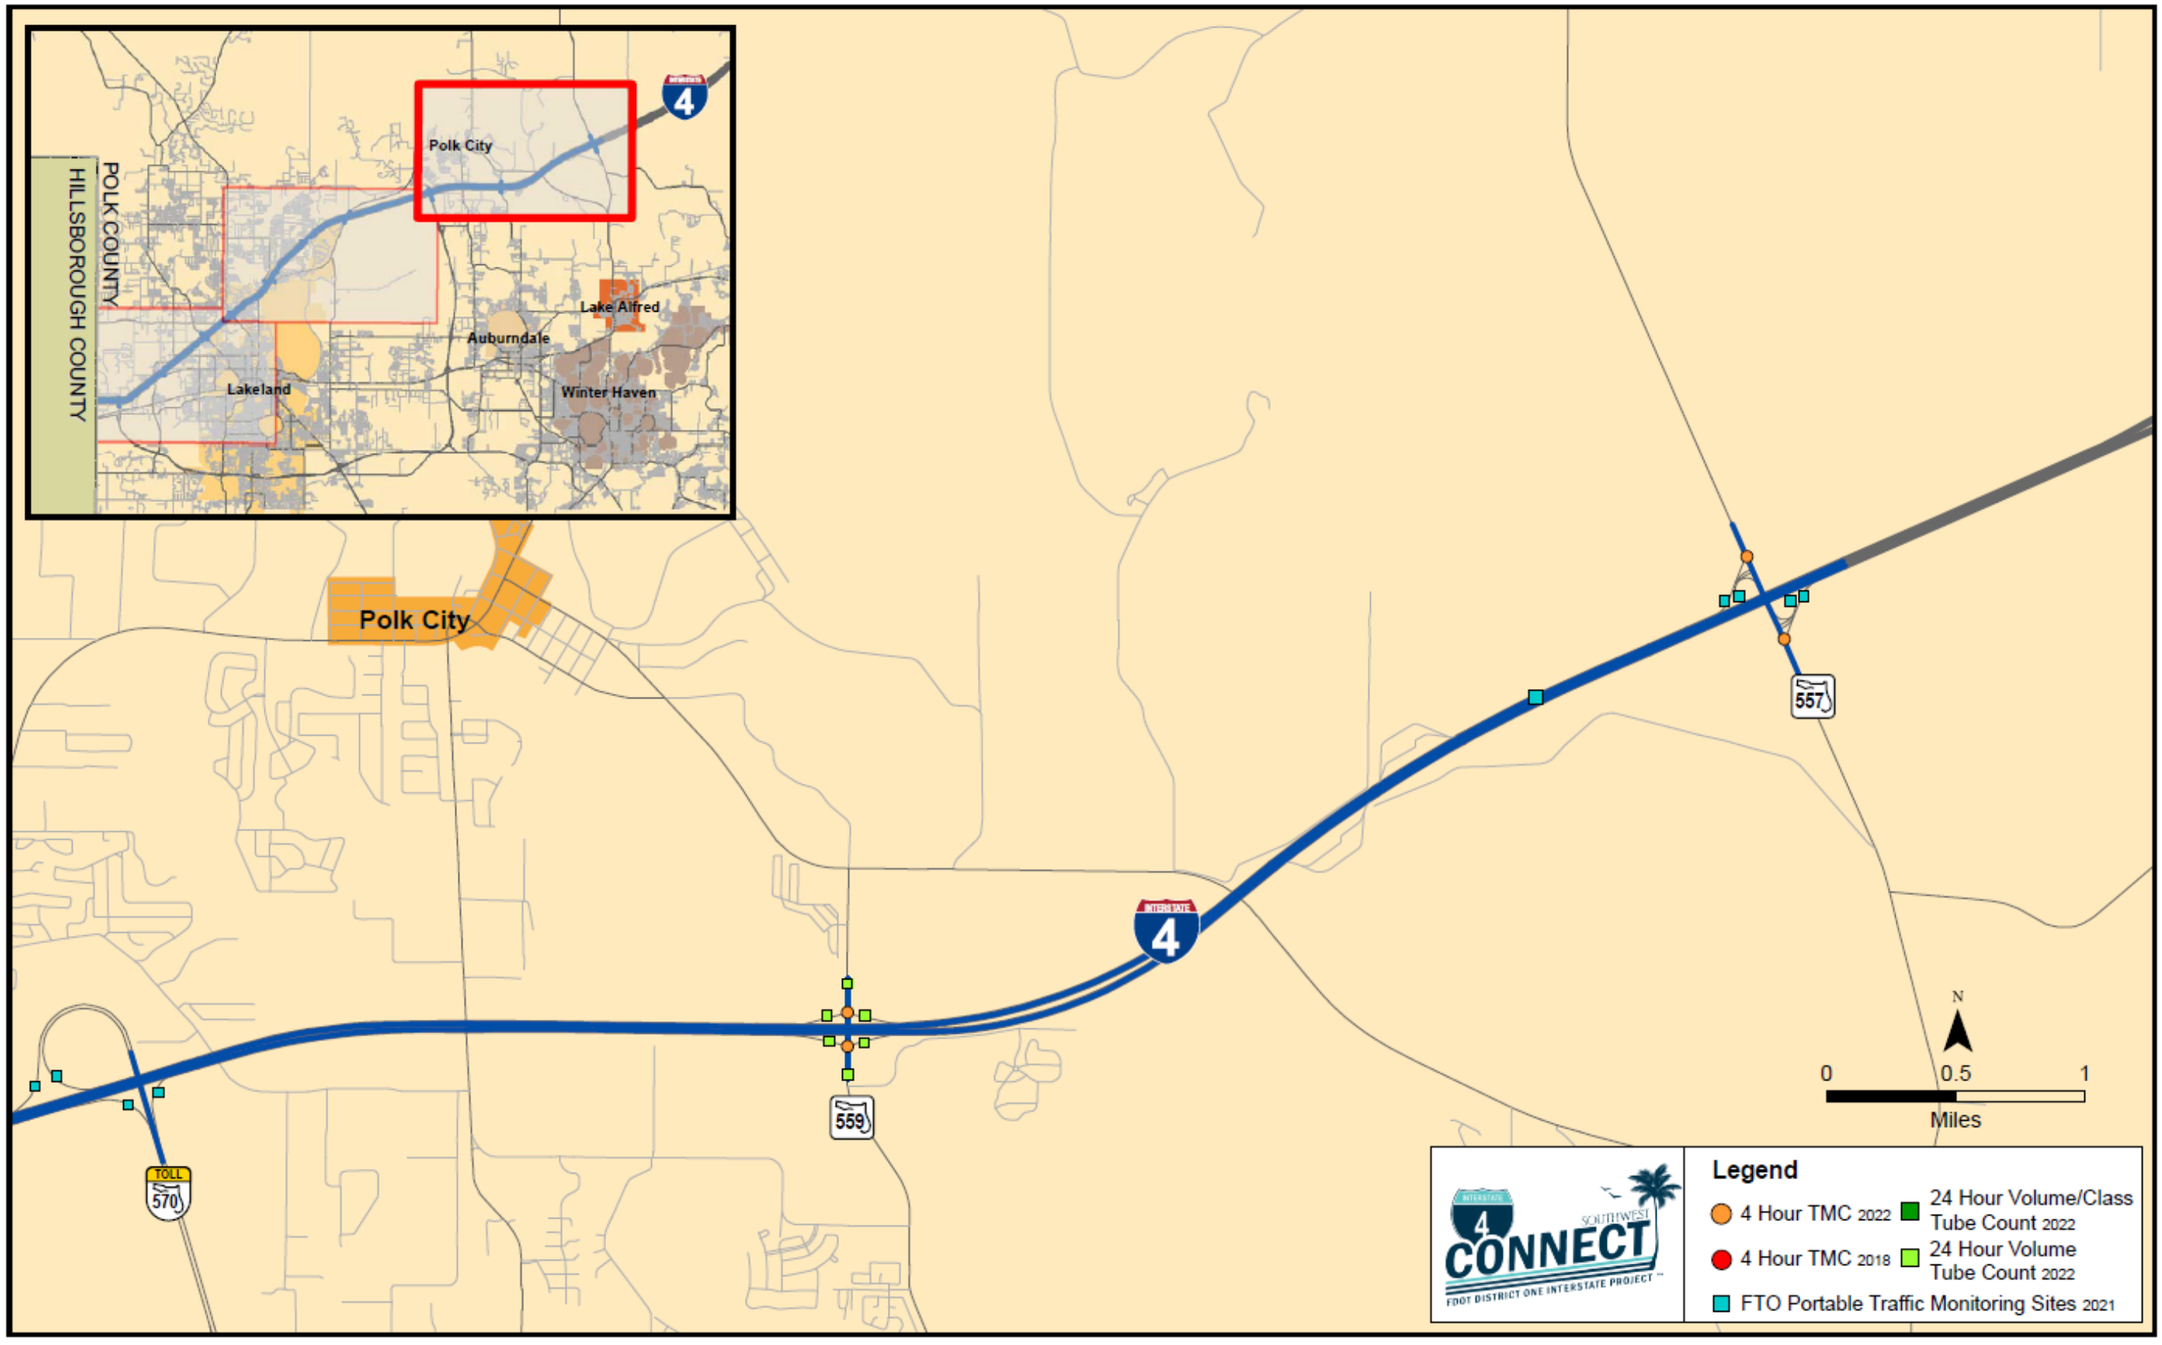

Following TMCs were taken from the I-4 Selected Interchanges Analysis Report (SIAR):

- I-4 and US 92/SR 546 (West Memorial Boulevard)
- I-4 and SR 539 (Kathleen Road)

Note that SIAR data from year 2018 was used for turning movement percentage only.

I-4 mainline count data was obtained from 2021 FDOT's Florida Traffic Online database. Based on the *FTO and I-4 Selected Interchanges Analysis Report (SIAR),* the peak hours were determined to be 7:15 AM-8:15 AM for the AM peak hour and 4:45 PM – 5:45 PM for the PM peak hour for the I-4 mainline. The supporting traffic counts and signal timing data are included in **Appendix B.**

4.0 Existing Traffic Volumes

Existing Year 2022 Annual Average Daily Traffic (AADT) volumes were developed by applying appropriate seasonal adjustment factors (SF) and axle correction factors (AF) to the Average Daily Traffic (ADT) obtained from recent available traffic counts or new counts collected to supplement available counts. Historical growth rates along I-4 corridor were calculated based on the past 10 years. **Table 1** below shows the comparison of growth rates before and after Covid-19 impacts. The results show two percentage points less between the two scenarios growth rate estimates (4.84% minus 3.03%).

Table 1

Annual Average and Annual Historical Growth Rate on I-4

FDOT Count Site	To/From	Annual Average Growth Rate (2012 - 2021)	Trend Annual Historical Growth Rate (2012-2021)	Annual Average Growth Rate (2010 -2019) Pre COVID	Trend Annual Historical Growth Rate (2010-2019) Pre COVID

Anchor Point Selection

A count location just east of SR 539 (Kathleen Road) (FDOT Count Site ID 160116) was selected as an anchor point. The 2021 AADT based on FTO at this location is 112,000 vehicles per day (vpd). The year 2022 AADT at this segment was developed by multiplying the 2021 volume by a 5% growth rate (117,600 vpd). **Table 3** shows the comparison between FTO data from 2019 thru 2021 and estimated AADTs for year 2022. An average growth rate of 3.1% from year 2019 (Pre Covid-19) to year 2022 considered to be reasonable. Additionally, based on the traffic data at station 160108, year 2022 estimated balanced traffic is only 300 vpd more than year 2021 AADT. Using less than 5% growth rate along the corridor will produce estimated 2022 traffic volumes that would be lower than 2021 at this location, which was not deemed reasonable.

Therefore, an average trend annual growth rate of 5% (before COVID-19 pandemic) was applied to previous year counts to develop year 2022 AADTs. The 2021 ramp AADTs then were multiplied by a 5% growth rate and adjusted to achieve mainline balanced volumes in between the interchanges. The 2022 AADTs are presented on **Figure 3**.

Table 3

Approved Design Traffic Factors

Table 4 illustrates the traffic factors for I-4 mainline and ramps.

Table 4
Design Traffic Factors for I-4 Corridor

Roadway	K_{STD}	D	T	Tf
I-4 Mainline	9.0	52.0	14.0	7.0
I-4 Ramps	9.0	100.0	14.0	7.0
Arterials	9.0	*	*	*

*Source: * D and T factors were estimated based on 2021 FTO.*
The Standard K is from FDOT Project Traffic Forecasting Handbook

Note that based on the approved methodology, turning movement traffic counts were performed at some selected locations. No tube counts were collected except at SR 559 interchange ramps. Historic D-Factor, heavy vehicle percentage, peak to daily ratios, growth rate estimations were documented in the **Appendix C.** Cross street growth rates, peak directions, D-Factor, and T-Factor were also included in **Appendix C** as a reference**.**

D-Factor

A historical D factor has been developed by averaging the estimated D factor from permanent count stations along I-4 over a ten-year period based on FDOT FTO data.

Peak Hour Factor

Peak Hour Factor (PHF) is the ratio of total peak hour volume to the peak rate of flow within the hour. It accounts for the variability of traffic within the hour. Existing PHFs were considered from the latest count data for existing operations analysis.

T-Factor

The historical T-Factors based on FTO along I-4 corridor and at the individual ramps are summarized in **Table 5** and **6**, respectively. An average daily track percentage at the ramps is approximately 14%, which is similar to I-4 mainline truck daily traffic percentage. Therefore, it was deemed reasonable to assume a T-Factor of 7% on the ramps during the peak hours.

K-Factor

Based on information obtained from FDOT Project Traffic Forecasting (2019) handbook, a Standard K-Factor of 9.0 percent was used in development of the Existing Year (2022) and the future year traffic volumes. This is the predominant K-Factor utilized in urbanized, transitioning to urbanized, and urban areas and represents a typical weekday peak hour. Directional Design Hour Volumes (DDHVs) were developed by applying the Standard K Factor of 9.0 percent and Directional Factor (D) to the AADT volumes based on the approved methodology. Actual peak to daily ratios along I-4 corridor ranges from 5.58% to 7.47% (See **Table** 7).

Existing Traffic Volumes

The peak hours were determined to be 7:15 AM-8:15 AM for the AM peak hour and 4:45 PM – 5:45 PM for the PM peak hour. Directional Design Hour Volumes (DDHVs) for existing year 2022 were developed by applying the Standard K Factor of 9.0 percent and Directional Factor (D) to the 2021 AADT volumes for mainline, ramps and ramp terminals. The peak direction of travel was assumed to be consistent with the existing counts. At the intersections, the existing turning movement volumes were obtained by applying the existing turning movement percentages to the approach volumes. The Vissim model was calibrated based on 'raw' AM and PM peak hour volumes which were collected from the field and have been reviewed and adjusted for accuracy. The Existing Year (2022) AM. and PM peak hour traffic is shown on **Figure 4**. The supporting documentation is included in **Appendix C**.

5.0 Traffic Operations Analysis Methodology

The Highway Capacity Software (HCS7) Version 7.9 was used to identify Level of Service (LOS) along freeway segments. The HCS7 is based on Highway Capacity Manual Sixth Edition (HCM 6th Edition) methodologies. The HCM 6th Edition estimates level of service based on density – a function of flow rate (volumes) and travel speed – for uninterrupted flow facilities such as basic freeway/Collector-Distributor (C-D) roadway segments, merge and diverge segments, and freeway/C-D roadway weaving segments. Density is measured in passenger cars per mile per lane (pcpmpl). For freeway merge and diverge areas, the HCM methodology also includes a capacity check for the influence area and the upstream or downstream ramp roadway. The HCM 6th Edition LOS and density targets for freeway segments are listed in **Table 9**.

Table 9
Freeway Segments HCM 6th Edition Level of Service Criteria

LOS	Basic Density (HCM Exhibit 12-15)	Merge and Diverge Density (HCM Exhibit 14-3)	Weaving Density (HCM Exhibit 13-6)
A	≤ 11	≤ 10	0 – 10
B	> 11 – 18	> 10 – 20	> 10 – 20
C	> 18 – 26	> 20 – 28	> 20 – 28
D	> 26 – 35	> 28 – 35	> 28 – 35
E	> 35 – 45	> 35	> 35 – 43
F	> 45	Demand Exceeds Capacity	Demand Exceeds Capacity

Note: Density measured in passenger cars/mile/lane (pcpmpl). Source: HCM 6th Edition

LOS was used as a primary measure of effectiveness. The LOS target for state roads during peak travel hours is "D" in urban areas, per the State Highway System Policy No. 000-525-006c. The Build Alternative would be designed to meet the established LOS D target to the greatest extent practicable in Design Year 2045.

A capacity and speed adjustment factors were determined based on following factors:

- I-4 Free-Flow Speed (FFS) – 75 mph
- I-4 Ramps Free-Flow Speed (FFS) – Posted or Advisory Speed Limit plus 5 mph
- I-4 peak hour truck percentage – 7%
- Lane width – 12 feet
- Driver Population – Mostly Familiar
- Weather Type – Non-Severe Weather
- Incident Type – No Incident
- Demand Adjustment Factor – 1.000

Signalized intersections were evaluated using Synchro Version 11, with levels of service identified based on the HCM 6th Edition LOS and delay targets presented in **Table 10**. Unlike the HCM, Synchro software has additional procedures for estimating control delay, such as the number of right turns on red and queue delay associated with starvation and spillback. Thus, Synchro delay estimation yields more accurate results than HCM because of these additional refinements.

Table 10
Signalized Intersection HCM 6th Edition Level of Service Criteria

Control Delay (sec/veh)	LOS by Volume-to-Capacity Ratio*	
	≤1.0	>1.0
(HCM Exhibit 19-8)		
≤10	A	F
>10 – 20	B	F
>20 – 35	C	F
>35 – 55	D	F
>55 – 80	E	F
>80	F	F

*For approach-based and intersection-wide assessments, LOS is defined solely by control delay. Delay is measured in seconds per vehicle. Control delay and volume-to-capacity ratio are used to characterize LOS for a lane group. Source: HCM 6th Edition. Note that Synchro delay has been reported for this study.

Unsignalized intersections were evaluated using the HCS Version 7.9, following the criteria presented in **Table 11**.

Table 11
Unsignalized Intersection HCM 6th Edition Level of Service Criteria

Control Delay (sec/veh)	LOS by Volume-to-Capacity Ratio*	
	≤1.0	>1.0
(HCM Exhibit 20-2)		
≤10	A	F
>10 – 15	B	F
>15 – 25	C	F
>25 – 35	D	F
>35 – 50	E	F
>50	F	F

*For approach-based and intersection-wide assessments, LOS is defined solely by control delay. Delay is measured in seconds per vehicle. Control delay and volume-to-capacity ratio are used to characterize LOS for a lane group. Source: HCM 6th Edition

Two-Way Stop Controlled intersection

The capacity of a minor-street approach depends on two factors:

- The distribution of available gaps in the major-street traffic stream
- The gap size required by drivers in other traffic streams to execute their desired movements

Selection of Measures of Effectiveness (MOE)

- Signalized/unsignalized Intersections – Volume, control delay, LOS, maximum queue lengths (95th percentile queues)
- Freeway Segments – Volume, density, LOS; demand to capacity ratio, speed
- Ramp Merge/Diverge – Volume, density, LOS, demand to capacity ratio, speed

6.0 Existing Conditions Traffic Operations Analysis

Traffic operations analyses for the AM and PM peak hours were conducted to document the LOS within the study area for the Existing Year (2022). **Figure 5** shows the existing lane configuration of I-4 mainline, ramps and ramp terminals used in the operational analysis.

The 2022 AM and PM peak hour traffic volumes were evaluated in each direction for freeway segments: basic, weave, and merge/diverge influence areas. HCS results are summarized in **Tables 12** and **13** for the eastbound and westbound directions, respectively. Most of the segments along I-4 operate at LOS D or better, except for these locations, which operate at an unacceptable LOS E/LOS F in one or both AM and PM peak hours:

- I-4 eastbound at Polk Parkway off-ramp diverge segment
- I-4 eastbound from Polk Parkway off-ramp to on-ramp basic segment
- I-4 eastbound from Polk Parkway on-ramp merge segment
- I-4 eastbound from Polk Parkway on-ramp to West Memorial Boulevard off-ramp basic segment
- I-4 eastbound at West Memorial Boulevard off-ramp diverge segment
- I-4 westbound from US 98 on-ramp to SR 539 (Kathleen Road) off-ramp basic segment
- I-4 westbound at SR 539 (Kathleen Road) off-ramp diverge segment
- I-4 westbound from SR 539 (Kathleen Road) on-ramp to West Memorial Boulevard off-ramp basic segment
- I-4 westbound at West Memorial Boulevard off-ramp diverge segment
- I-4 westbound from Polk Parkway off-ramp to on-ramp basic segment

Note that current conditions along I-4 may be different than the results listed above due to the calculated

design hour volumes using K-factor of 9% whereas actual the peak to daily ratios along I-4 corridor range from 5.58% to 7.47%.

Ramp speed reported under HCS7 is the speed of the ramp influence area and depends on the mainline speed. I-4 free flow speed is 75 mph, and the ramp influence area speeds are below that limit.

Signalized intersections were analyzed using Synchro Version 11. Unsignalized intersections were analyzed using the HCS software Version 7.9. Unsignalized LOS/Delay reported for worst movement. Note that heavy vehicle input for major street through and right movements at Two-Way Stop Control is not required based on HCM.

The analysis output summary for AM and PM peak hours are presented in **Table 14**. Several intersections within the study area are operating at LOS E or F in one or both AM and PM peak hours. These intersections include:

- I-4 and US 98 interchange
- I-4 and N Socrum Loop (CR 582) westbound ramp terminal
- I-4 and Lakeland Hills Boulevard eastbound ramp terminal
- I-4 and SR 33 eastbound ramp terminal
- I-4 and SR 559 both ramp terminals (unsignalized)
- I-4 and SR 557 both ramp terminals (unsignalized)

The existing Synchro and HCS output sheets are included in **Appendix D**.

7.0 Transportation Systems Management and Operations

As part of I-4 Master Plan, the widening of I-4 and improvement of the interchanges within the study area are being evaluated. With long-term solutions several years out, the benefits of near-term Transportation Systems Management and Operations (TSM&O) improvements at the ramp merge/diverge areas were evaluated to assess the effectiveness to eliminate potential unsafe queuing into the mainline lanes and improve overall near-term operational benefits.

TSM&O alternatives are generally low-cost improvements which are designed to maximize the use and efficiency of the existing transportation facilities through improved systems management. The purpose of this study is to identify the existing general problems and recommend low-cost interim improvements which will improve the mobility of users at the existing interchange. The analysis was based on existing year 2022 traffic volumes.

There are several merge/diverge segments within the study area that operate at undesirable LOS of E or F in either of the AM or PM peak hours in year 2022. These ramp junctions along with the deficiencies are listed below:

- I-4 eastbound at Polk Parkway off-ramp diverge segment: Upstream mainline deficiency. Needs widening of thru lanes which is part of the long-term solutions (Master Plan study).
- I-4 eastbound from Polk Parkway on-ramp merge segment: Downstream mainline deficiency. Needs widening of thru lanes which is part of the long-term solutions (Master Plan study).
- I-4 eastbound at West Memorial Boulevard off-ramp diverge segment: Upstream mainline deficiency. Needs widening of thru lanes which is part of the long-term solutions (Master Plan study).
- I-4 westbound at SR 539 (Kathleen Road) off-ramp diverge segment: Extend the deceleration length to maximum 1500 feet if feasible. With the improvement, the diverge segment is anticipated to operate at LOS C during AM and PM, respectively.
- I-4 westbound at West Memorial Boulevard off-ramp diverge segment: Extend the deceleration length to maximum 1500 feet if feasible. With the improvement, the diverge segment is anticipated to operate at LOS C during AM and PM, respectively.

The TSM&O improvements will also enhance safety as it reduces congestion.

8.0 Alternatives

Phase 1 Feasibility Study Summary:

- Alt. 1 – Add 2 general use lanes (GULs) in each direction
- Alt. 2 – Add 2 buffer separated express lanes (ELs) in each direction
- Alt. 3 – Add 2 barrier separated express lanes (ELs) in each direction
- Alt. 4 – Add 1 GUL and 1 HOV lane in each direction

(Note: Buffer/barrier separation does not affect traffic operations, so Alternative 2 and Alternative 3 were analyzed as Alternative 2 at the Feasibility stage. HOV lanes can be accommodated in express lanes, but not vice versa, so Alternative 4 is not recommended to be carried forward.)

Based on operational and safety analyses as well as public input collected, Build Alternative 1 and 2 were recommended to be evaluated further in the Phase 2/Master Plan.

The following alternatives were considered during the preliminary analysis Phase 2 of the project using the Design Year traffic forecasts for I-4 and interchanges within the project limits.

- No-Build Alternative: The No-Build (no action) Alternative will include currently planned and programmed improvements or projects with construction phases identified in cost feasible plans:
    - I-4 interchange improvements at CSX Railroad (bridge replacement)
    - SR 33 interchange modification - roundabout
    - SR 557 interchange modification – roundabout
    - SR 559 interchange ramp terminals – signalized
- Build Alternatives: Addition of General Purpose (GP) lanes and addition of Managed lanes
    - **Build Alternative 1** included I-4 mainline widening from six to ten lanes: addition of two General Purpose Lanes (GPLs) on each direction.
    - **Build Alternative 2** included I-4 mainline widening from six to ten lanes: addition of two Express/High Occupancy Toll (HOT) lanes on each direction.

Build Alternatives were selected based on discussion with FDOT D1 and I-4 Master Plan team.

9.0 Travel Demand Forecasting (No-Build Alternatives)

The District One Regional Planning Model (D1RPM) 2015 Base Year and the 2045 Cost Feasible Model were provided by the Department. Calibration and validation of the D1RPM was completed by the PD&E Team.

The model AADTs from Phase 1 study were reviewed for reasonableness. The National Cooperative Highway Research Project (NCHRP) Report 765, ratio and difference smoothing method was applied to obtain reasonable 2045 AADTs between 2021 and 2045 data. Note that year 2022 data was not utilized to develop the Design Year 2045 AADTs. The future 2045 DDHVs were developed by applying the existing turning movement percentages only to the 2045 approach volumes based on the approved methodology. Detailed tables showing the projected No-Build traffic estimations are provided in **Appendix C**. Growth rates and/or forecasted AADT volumes at the ramps are illustrated in **Table 16**. I-4 mainline corridor AADTs were developed by balancing the traffic in between the interchanges. The average annual growth rate from year 2022 thru 2045 along I-4 corridor within study area is 1.91%. **Table 17** illustrates the 2045 Design Year No-Build AADTs within the study area. Historical and population [Bureau of Economic and Business Research (BEBR)] growth rates in addition to model growth rates were compared.

The Design Hour Volumes (DHVs) for Design Year 2045 was developed by applying the Standard K Factor of 9.0 percent and Directional Factor (D) to the Design Year 2045 AADT volumes. The future year DDHVs were then derived by applying turn percentages obtained from the existing turning movement counts to the DHVs at the ramp terminals and other intersections. A smoothing process was employed to ensure that the resulting design hour traffic volumes comply with the design traffic factors K_{STD}, D, and that traffic flows balance between intersections/interchanges. The initial DDHVs were reviewed for reasonableness and were ensured to be higher than the existing peak hour turning movement volumes. The Design Year 2045 No-Build DDHVS during the PM peak hour were developed first and DDHVs for the AM peak hour were determined using the reciprocal movement of the PM peak hour volumes along mainline and ramps. The supporting future traffic projection documentations are in **Appendix E**. 2045 DDHVs are shown in **Figure 6**.

Table 15 shows the U.S. Census population data and population projections for 2020, 2025, 2035 and 2045 for Polk County based on Bureau of Economic and Business Research Report (BEBR), published by the University of Florida. Between 2021 and 2045, Polk County has an estimated growth rate of approximately 0.33% and 2.57% per year based on BEBR's low and high population estimates, respectively. The 2045 No-Build DDHVs is shown in **Figure 6**.

Table 15

Historical Population and Growth

Type of Projection	Estimated 2020 Population	Population Projection			Average Annual Growth Rate (2021-2045)
		2025	2035	2045

10.0 Travel Demand Forecasting (Build Alternatives)

The following Build Alternatives were considered during the preliminary analysis for Phase 2 of the project using the Design Year traffic forecasts for I-4 and interchanges within the project limits.

- **Build Alternative 1** included I-4 mainline widening from six to ten lanes: addition of two General Purpose Lanes (GPLs) on each direction.
- **Build Alternative 2** included I-4 mainline widening from six to ten lanes: addition of two Express/High Occupancy Toll (HOT) lanes on each direction.

Build Alternatives 1

The Build Alternative 1 model AADTs from Phase 1 study were reviewed for reasonableness. The National Cooperative Highway Research Project (NCHRP) Report 765, ratio and difference smoothing method was applied to obtain reasonable 2045 AADTs. Detailed tables showing the projected Build Alternative 1traffic estimations are provided in **Appendix E**. The smoothing method was performed between 2021 count data and 2045 model AADTs for the mainline and ramps. Ramps and Mainline AADTs for Build Alternative 1 are shown in **Table 18** and **Table 19**, respectively. Build Alternative 1 2045 DDHVs are shown in **Figure 12**.

Build Alternatives 2

Build Alternative 2 included I-4 mainline widening from six to ten lanes: addition of two Express/High Occupancy Toll (HOT) lanes on each direction. This section provides information on the development of future traffic daily forecasts, and design hour volumes using Express Lane Time-of-Day (ELToD) Model.

The ELToD Model v2.3 was the primary forecasting tool used to estimate 2045 traffic on the I-4 Managed Lanes (ML) and General Use Lanes (GUL) in the Phase 2 traffic analysis of the I-4 PD&E Study.

The ELToD Model is a forecasting tool developed by the Florida Turnpike Enterprise (FTE) to determine the percent share of traffic that chooses managed lanes during each hour of the day. It estimates the volume of traffic on both general use and managed lanes. In addition, it identifies the managed lanes dynamic toll by hour based on dynamic traffic conditions. The model works in conjunction with Florida's travel demand models which provide the basis for the total corridor traffic.

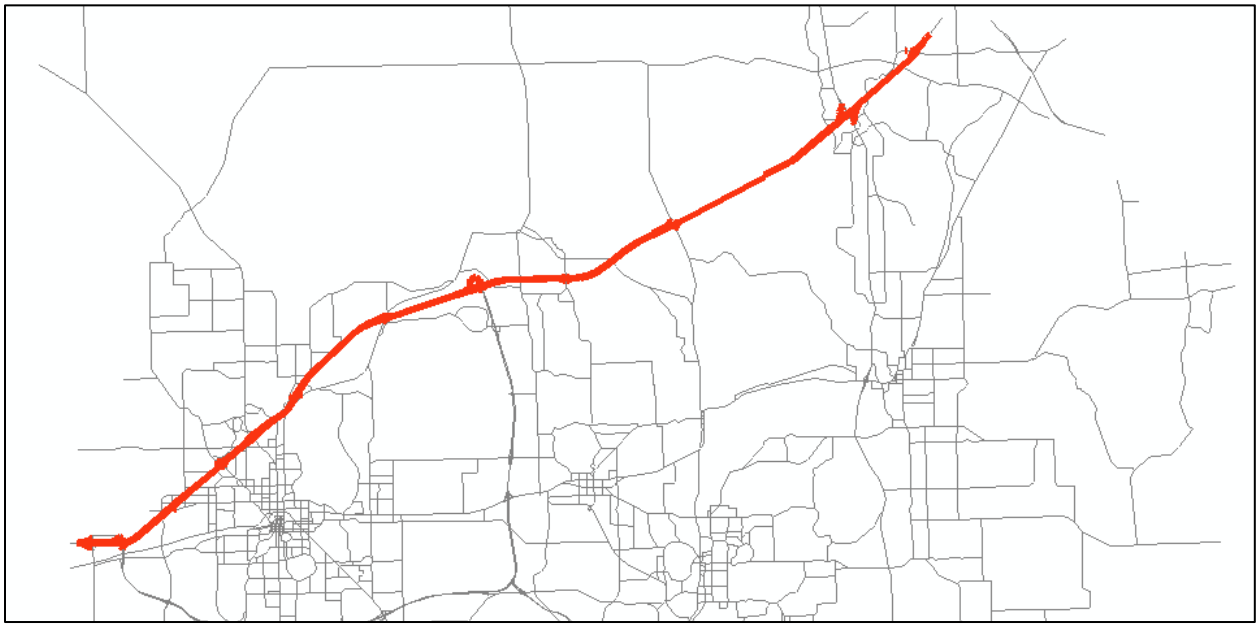
ELToD Setup

Phase 1 of the I-4 PD&E Study developed 2045 forecast AADTs for a Build alternative that included the addition of 4 tolled managed lanes to the existing 6 general use lanes on I-4 from the Polk Parkway (West) to SR 532. The 2045 I-4 No Build D1RPM developed by the IPM (based on the currently adopted 2045 D1RPM v2.0) was the primary travel demand forecasting tool used to model the Build alternative. The D1RPM v2.0 reports highway assignments in AADTs; therefore, the application of a Model Output Conversion Factor was not used. The Phase 1 Managed Lane Build model was the primary input into the ELToD Model used for the Phase 2 analysis. While the overall forecast corridor demand is the same as what was developed in Phase 1, the assignment of trips between the managed lanes and general use lanes is different due to the use of the ELToD model in Phase 2.

The I-4 corridor was extracted from the D1RPM Build model for input into the ELToD Model. When creating a corridor network file from a demand model, it is recommended that the subarea network polygon be designed so that one external node is created for each entrance or exit ramp. The **Figure 7** depicts the extent of the I-4 corridor that was extracted.

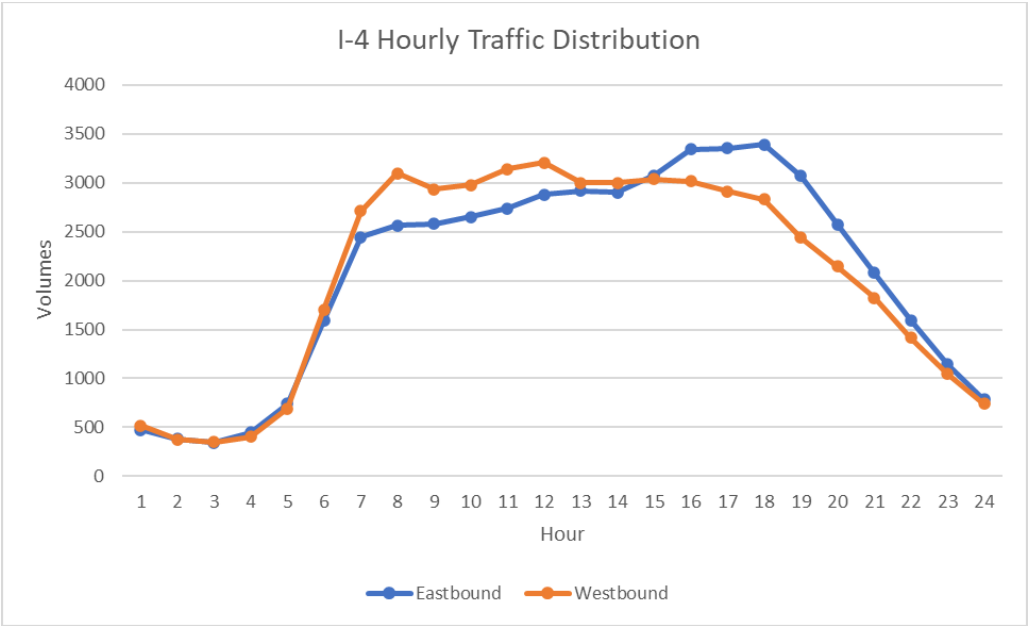
The location of the ingress/egress points for the managed lanes are consistent with those developed for the Phase 1 analysis. In the Phase 1 analysis, Streetlight and D1RPM origin/destination data was analyzed to develop an initial set of managed lanes access points. The D1RPM I-4 model was used to conduct sensitivity tests to determine the impact on managed lane utilization of various access scenarios. These tests along with coordination and direction from the I-4 PD&E Project Team determined the final set of access points that were used.

Figure 7
D1RPM Build Model Extracted Corridor



Hourly traffic counts were the primary data source used to calculate the temporal distribution of traffic. To obtain the necessary continuous traffic count data needed for input into the model, the identification of a FDOT Telemetered Traffic Monitoring Site was conducted and Polk County count station 9951: I-4, 0.6 MI W OF SR-559 was used. **Figure 8** illustrates the hourly traffic distribution that was input into the model.

Figure 8
I-4 Hourly Traffic Distribution



Toll Rates

Minimum toll rates for the managed lane system were input into the ELToD Model at $0.14/mile which is consistent with the Phase 1 analysis.

Model Inputs

Network attributes for Facility Type, Area Type, Free Flow Speed and Per Lane Capacity were used from the D1RPM Phase 1 Build model. Volume Delay Function and Toll Choice Coefficient attributes included in the ELToD Model dataset were used as they have been calibrated by FTE based on observed data from existing managed lane systems in the state.

ELToD Results

The ELToD Model produces 24 one-hour forecasts. For the purposes of the traffic analysis, focus was put on the AM peak hour (8 AM – 9 AM) and the PM peak hour (5PM - 6PM). **Figure 9** illustrates the 2045 AM and PM peak traffic for the GUL and ML system.

Figure 10 illustrates the managed lane utilization by direction for the AM and PM peak hours. As the figure shows the demand for managed lanes during the peak hour varies along different segments of the corridor. For example, for both eastbound and westbound direction, segment 4, from Kathleen Rd to SR 33 W Socrum Loop Rd, has the lowest managed lane demand of total peak hour traffic whereas segment 9, from CR 557 to US 27, has the highest managed lane utilization percent during the AM and PM peak hours. The figure sheds light on geographical distribution of managed lane traffic volume along the corridor and can be used to further refine minimum toll amount for each segment and the location of slip ramps.

Figure 11 provides additional information on toll pricing structure in the model where toll amounts are calculated based on travel demand in the express lanes. The figure presents the minimum toll amount which was input by the modeler and the calculated maximum toll amounts for each segment along the corridor during peak travel periods. The calculated tolls are the maximum amounts that can be charged without deterring road users from using the managed lanes on each segment. This is helpful in deciding setting the toll amounts or adjusting the minimum toll for the segments.

Figure 13 Page 3 of 3

11.0 Consistency with Plans/Projects

Funding for the Project development and Environment (PD&E) study is in the currently adopted Five-Year Work Program as listed below:

- 442512-1 and 442512-2: I-4 (SR 400) west of SR 570 (Polk Parkway) to west of US 27 interchange, PD&E Study, FY 2020/2021
- Florida's SIS Long Range Cost Feasible Plan FY 2029 – 2045 has identified funds for Design and Right of Way

The I-4 PD&E study has maintained consistency with the FDOT Work Program:

- I-4 interchange improvements at CSX Railroad (bridge replacement), Currently under construction.
- SR 33 interchange modification – roundabout, Highways/Preliminary Engineering and Right-of-Way acquisition underway. Fiscal Year 2028 for Construction.
- SR 557 interchange modification – roundabout, under construction.
- SR 559 interchange ramp terminals – signalized, Fiscal Year 2024 for construction.

There is no letting plan till beginning of the Fiscal year.

12.0 No-Build Alternative Traffic Operations Analysis

Traffic operations analyses for the AM and PM peak hours were conducted to document the LOS within the study area for No-Build Design Year 2045. **Figure 14** shows the existing plus committed improvements lane configuration of I-4 mainline, ramps and ramp terminals used in the operational analysis.

The Design Year 2045 AM and PM peak hour traffic volumes were evaluated in each direction for freeway segments: basic, weave, and merge/diverge influence areas. HCS results are summarized in **Tables 22** and **Table 23** for the eastbound and westbound directions, respectively.

The results of the operation analysis show that most of the segments along I-4 operate at an unacceptable LOS during both the AM and PM peak hours. Capacity deficiencies are present under the existing condition and are expected to increase in the future.

The No-Build Design Year 2045 signalized intersections analysis output summary for AM and PM peak hours are presented in **Table 24**. The signalized intersection operations were optimized for signal splits/offsets. Committed improvements at the SR 33 and SR 557 interchanges (roundabouts) were also coded in the Synchro files and also analyzed using SIDRA (See **Table 25**). SR 559 and I-4 interchange both ramp terminals have been analyzed as signalized intersections. The Synchro, SIDRA and HCS output sheets are included in **Appendix G**. Following intersections are anticipated to operate LOS E or LOS F by No-Build Design Year 2045:

- US 98 and I-4 ramp terminal

- North Socrum Loop Road (CR 582) and I-4 westbound ramp terminal
- Lakeland Hills Boulevard and I-4 eastbound ramp terminal
- SR 559 and I-4 westbound ramp terminal
- SR 557 and I-4 both ramp terminals (roundabout)

The analysis shows with traffic increasing, levels of service at the intersections above will continue to deteriorate and operate at unacceptable LOS in year 2045.

13.0 No-Build Year of Failure Traffic Analysis

The purpose of the Year of Failure analysis is to determine traffic operations for interchanges and I-4 mainline lane requirements within the project's study area for interim years. It is utilized to evaluate if/when (what year) study area interchanges and I-4 corridor mainline segments are projected to become deficient. The Year of Failure for mainline and ramps were determined based on interpolation between year 2021 and year 2045. The Year of Failure for ramp terminals were determined based on growth factor adjustments procedure using Synchro software which is reasonable for the intersection analysis.

Year of Failure for Ramp Terminals

For the No-Build Alternative, the annual growth rate is 1.91% along I-4 corridor from the existing conditions to the design year (2045) conditions. Traffic volumes for interim years were calculated by reducing the design year volumes by 1.91% per year. The growth/reduction factor under Synchro and SIDRA software was used to adjust traffic volumes for each interim year. In the case that traffic operations are anticipated to fail by the design year, an iterative traffic analysis was performed to determine the year when traffic starts to operate below LOS D. The summary of years of failure for ramp terminals are illustrated in **Table 26**. Following ramp terminals are anticipated to operate at an acceptable LOS D or better by Design Year 2045 under No-Build Alternative:

- I-4 and US 92/SR 546 (West Memorial Boulevard)
- I-4 and SR 539 (Kathleen Road)
- I-4 and SR 33 (roundabout)
- I-4 and SR 559 Eastbound Ramp terminal

The list of interchanges with the Year of Failure are stated below:

- I-4 and US 98/SR 35/SR 700 – ***Year 2034***
- I-4 and CR 582 (North Socrum Loop Road)/SR 33 (Lakeland Hills Boulevard) –***Year 2022***
- I-4 and SR 559 Westbound Ramp Terminal – ***Year 2044***
- I-4 and SR 557 westbound ramp terminal roundabout – ***Year 2034*** and eastbound ramp terminal roundabout – ***Year 2035***

Higher growth rates at the ramp terminals will result in lower opening interim years peak hour volumes and could result in operational deficiencies being reported later than expected (See **Appendix H**). Although ramp growth rates varied widely by interchange, ranging between 1% to 7%, it was deemed reasonable to assume a growth rate of 1.91% along the I-4 mainline corridor.

The design year forecasted traffic volumes from SR 557 at I-4 Interchange Modification Report (1/31/2019) was compared and discussed with District One during Phase 1 of the I-4 Master Plan traffic study. The difference was due to post processing and traffic balancing.

Table 26: Year of Failure Analysis - Intersection

Synchro Version 11 Build 168

LOS Notes:

Delay is in sec/veh units

:Level Of Service (LOS) E reflecting at capacity operations

:Level Of Service (LOS) F reflecting over capacity operations

Results

1 :Synchro

2 :HCS

3 :SIDRA

Note: 1. All the signal timings have been optimized for splits and offsets. The signal phase for right turn movements have been maintained based on existing signal phasing

2. Synchro does not account for queue spillover effects. Queue lengths from Synchro would not be realistic, especially for future conditions analysis to account for the spill back. Off-ramp queues based on 2045 No-Build Alternative are documented in **Appendix H**.

Mainline and Ramp Lane Requirements

Future lane requirements were evaluated to provide an estimated timeline for the onset of capacity deficiencies along the I-4 corridor. Freeway mainline level of service targets were based on the 2023 FDOT Quality/LOS Handbook and adjusted based on 7% truck. Capacity analysis for ramp roadways was based on adjusted targets from the HCM 6th Edition.

Worst-case volumes during AM or PM peak hours were considered for this planning level analysis. Also, the highest volume between on and off ramps were considered.

Freeway capacity was adjusted based on HCM 6th Edition procedure below

The capacity of the freeway was taken from HCM 6th edition document and adjusted based on HCM 6th edition as follow:

Adjusted Demand Volume $v_p = V/ (PHF \times N \times f_{HV})$ (HCM 6th Edition Equation 12-9)

$f_{HV} = 1/(1+P_T(E_T - 1)$ (HCM 6th Edition Equation 12-10)

$E_T = 2$ (HCM 6th Edition Exhibit 12-25)

Table 27

Parameters

Data	
K_{STD}	9.00%
$D^{(1)}$	52.00%
Truck % $(T_f)^{(1)}$	7.00%
$RVs^{(2)}$	0.00%
Peak Hour Factor $(PHF)^{(1)}$	0.95
Population Factor $(P_T)^{(2)}$	1.00
$Grade^{(2)}$	0.00%
$Terrain^{(2)}$	Level
Lane $Width^{(2)}$	12.00 ft

(1) Source: I-4 Master Plan - Traffic Factors

(2) Source: HCM 6th Edition default value.

Capacity of a basic freeway segment for free flow speed of 75 mph is 2,400 pc/h/ln (HCM 6th Edition Exhibit 12-4). **Table 28** showed the adjusted capacity for 6, 8 and 10 lanes. The calculation is attached in **Appendix H.**

Table 28

Freeway Capacity

Lane	Capacity of Basic Freeway Segment (pc/h/ln)	Adjusted Capacity
2	N/A	N/A
3	7200	5800
4	9600	7700
5	12000	9600

Adjusted freeway capacity (reduced 10% for FFS 75 mph LOS D)

HCM 6th Edition: Exhibit 12-4

Ramp capacity was adjusted based on HCM 6th Edition procedure below.

The parameters were considered from **Table 27** and adjustment for demand volume formulas as shown under freeway capacity adjustment. Ramp capacity was adjusted based on above procedure from the base capacity listed below (source HCM 6th Edition). The calculation is attached in **Appendix H.**

Table 29

Ramp Capacity

	Ramp Capacity (pc/hr)		Ramp Capacity (veh/hr) LOS D	
FFS (mi/hr)	1-lane	2-lane	1-lane	2-lane
>50	2200	4400	1760	3520
>40-50	2100	4200	1680	3360
>30-40	2000	4000	1600	3200
>20-30	1900	3800	1520	3040

Adjusted Ramp capacity (reduced 10% for LOS D)

HCM 6th Edition: Exhibit 12-16

Tables 30 shows the detailed color-coded future lane requirements corresponding to LOS D (maximum service volume) for No-Build for the freeway mainline:

- I-4 mainline segments at SR 570 (West Polk Parkway) is projected to operate at deficient levels of service by year 2033 and need for 10-lanes roadway improvement.
- I-4 mainline segments at West Memorial Boulevard is projected to be deficient by year 2039 and need for 10-lanes roadway improvement.
- I-4 mainline segments at US 98/SR 35/SR 700 is projected to be deficient by year 2045 and need for 10-lanes roadway improvement.
- I-4 mainline segments from CR 582 (North Socrum Loop road) to SR 557 (East Polk Parkway) are projected to be deficient and need for 10-lanes roadway beyond year 2045.
- Single lane exit and entry ramps are anticipated to operate at acceptable levels of service up to the Design Year 2045 for No-Build conditions.

14.0 Build Alternatives Traffic Operational Performance

The Highway Capacity Software (HCS7) Version 7.9 was used to identify Level of Service (LOS) along freeway segments. The HCS7 is based on the Highway Capacity Manual Sixth Edition (HCM 6th Edition) methodologies.

Capacity and speed adjustment factors were determined based on following factors:

- I-4 Free-Flow Speed (FFS) – 75 mph
- I-4 Ramps Free-Flow Speed (FFS) – Posted or Advisory Speed Limit plus 5 mph
- I-4 peak hour truck percentage – 7%
- Lane width – 12 feet
- Driver Population – Mostly Familiar
- Weather Type – Non-Severe Weather
- Incident Type – No Incident
- Demand Adjustment Factor – 1.000

Signalized intersections were evaluated using Synchro Version 11. Roundabout intersection has been analyzed using SIDRA Intersection Version 9 software. The peak hours were determined to be 7:15 AM-8:15 AM for the AM peak hour and 4:45 PM – 5:45 PM for the PM peak hour for this study as stated under the methodology.

Selection of Measures of Effectiveness (MOE)

- Signalized/unsignalized Intersections – Volume, control delay, LOS, maximum queue lengths
- Freeway Segments – Volume, density, LOS; demand to capacity ratio, speed
- Ramp Merge/Diverge – Volume, density, LOS, demand to capacity ratio, speed

Build Alternatives

Traffic operations analyses for the AM and PM peak hours were conducted to document the LOS within the study area for Build Design Year (2045). Following two Build Alternatives were considered:

- Build Alternative 1 included I-4 mainline widening from six to ten lanes: addition of two General Purpose Lanes (GPLs) on each direction (See **Figure 15**).
- Build Alternative 2 included I-4 mainline widening from six to ten lanes: addition of two Express/High Occupancy Toll (HOT) lanes on each direction (See **Figure 16**). Capacity of the Express Lanes were adjusted by assuming zero percentage of heavy vehicle. All other parameters were considered based on the approved methodology.

The 2045 AM and PM peak hour traffic volumes were evaluated in each direction for freeway segments: basic, weave, and merge/diverge influence areas. For the managed lane analysis, it was assumed as buffer lane separation (this may subject to change based on upcoming public meeting).

SOUTHWEST I-4 CONNECT FDOT DISTRICT ONE INTERSTATE PROJECT	Project Development and Environment (PD&E) Study I-4 (SR 400) From West of SR 570 (Polk Parkway) to West of US 27 Interchange (Phase 2)	2045 (Build Alternative 2) Lane Geometry	Figure 16 Page 3 of 3

HCS results are summarized in **Tables 31** and **Table 32** for the eastbound and westbound directions under Alternative 1. Majority of the freeway segments along I-4 are expected to operate LOS D or better with addition of two GPLs on each direction except following locations:

- I-4 eastbound at West Memorial Boulevard off-ramp – upstream mainline deficiency (diverge area)
- I-4 eastbound at US 98 off-ramp – upstream mainline deficiency (diverge area)

Table 33 thru **Table 35** represent the Build Alternative 2 HCS freeway analysis for the GPLs and ELs, respectively. Vehicular congestions were identified along GPLs (three lanes on each direction) under this alternative. However, ELs are anticipated to operate under capacity during peak hours. Addition of auxiliary lanes between falling segments anticipated to improve traffic operation which will be discussed during PD&E study. ***Nevertheless, the Build Alternatives are anticipated to improve traffic operations.***

Note that two-sided weaving analysis will be performed by Vissim after the locations of slip-ramps are determined in the upcoming PD&E study. Vissim is a microscopic traffic flow simulation model based on car following, lane change, and queuing logic. Vissim has the ability to model Express Lane (EL), High Occupancy Vehicle (HOV) lanes, and other transportation strategies that are being implemented within the state. Vissim models each individual vehicle within the network to identify simulated performance measures for freeways, ramps, and intersections.

Further discussion with I-4 Master Plan Teams is required to confirm if that heavy vehicles would be permitted in the inside lane of the ML facilities. Note that HCS software does not have capability to code the inside lanes of ML facilities with heavy vehicles.

Intersection Analysis

The Build Design Year 2045 intersections analysis ***based on existing and committed improvements only*** and output summary for AM and PM peak hours are presented in **Table 36 thru 39,** for Build Alternative 1 and Alternative 2, respectively. The signalized intersection operations were optimized for signal splits/offsets. Committed improvements at the SR 33 and SR 557 interchanges (roundabouts) were also analyzed using SIDRA. The Synchro, SIDRA and HCS output sheets are included in **Appendix I**.

Note that due to the relatively complex traffic operations of the 'Tear Drop' roundabout at SR 557 and SR 33, it is recommended to further analyze the ramp terminal with the microsimulation which is not part of the Phase 2 methodology.

The Facility Enhancement Element memorandum will address long-term improvements for I-4 mainline and interchange(s). Existing conditions Vissim calibration and future analysis using Vissim model for the I-4 at US 98 and I-4 at North Socrum Road/Lakeland Hills Boulevard interchanges along with adjacent arterial intersections will be submitted in a separate memo.

A planning level improvement at the interchanges are discussed here. It should be noted that the intersection improvements illustrated in the memo are for general planning and discussion purposes only and do no determine the engineering and operational acceptability (See **Appendix I**):

- I-4 Eastbound off-ramp and SR 33 -modify the eastbound off ramp right turn lane by adding a

receiving lane instead of merge lane.

- I-4 Eastbound off-ramp and SR 557 - modify the eastbound off ramp right turn lane by adding a receiving lane instead of merge lane.
- I-4 Westbound off-ramp and SR 557 – modify the westbound off ramp right turn lane by adding a receiving lane instead of merge lane.

Detailed Vissim microsimulation analysis is anticipated in the PD&E phase. **Table 40** illustrates the overall delay comparison between No-Build and Build Alternatives and upcoming actions for further traffic analysis.

The benefits of the Build alternative must be looked at from a global perspective due to the extensive nature of the improvements, as opposed to single isolated locations.

Phase 2 traffic analysis is intended for general planning purposes and will not determine the engineering and construction acceptability for the managed lanes and interchange capacity improvements. The ultimate capacity improvement of this project involves the potential construction of managed lanes in each direction of I-4 and interchange improvements which will be analyzed later in PD&E study.

Heavy vehicle restrictions in the future managed lanes (MLs) requires further discussion with the District One.

The Facility Enhancement Element memorandum will address long-term improvements for I-4 mainline and interchange(s). Existing conditions Vissim calibration and future analysis using Vissim model for the I-4 at US 98 and I-4 at North Socrum Road/Lakeland Hills Boulevard interchanges along with adjacent arterial intersections will be submitted in a separate memo.

Table 31: 2045 Build Alternative 1, HCS Level of Service and Density for I-4 Eastbound Segments, General Purpose Lane (GPL) only

	*SR 33 & I-4 Westbound	A (6.2)	C (15.4)	C (15.4)	Operating at an acceptable LOS	B (10.1)	D (33.6)	D (33.6)	Operating at an acceptable LOS
	*SR 33 & I-4 Eastbound	B (13.8)	E (41.2)	E (41.2)	Volumes increased under Build Alternatives. Interchange will be evaluated using improvement(s) in upcoming traffic memo	C (21.6)	F (63.8)	F (63.8)	Volumes increased under Build Alternatives. Modify the eastbound off ramp right turn lane by adding a receiving lane instead of merge lane. See Appendix I
	SR 559 & I-4 Westbound	E (58.0)	F (81.5)	F (81.5)	Volumes increased under Build Alternatives. Interchange will be evaluated using improvement(s) in upcoming traffic memo	D (46.2)	D (50.8)	D (50.8)	Operating at an acceptable LOS
	SR 559 & I-4 Eastbound	C (28.1)	C (28.2)	C (28.2)	Operating at an acceptable LOS	C (26.9)	D (37.6)	D (37.6)	Operating at an acceptable LOS
	*SR 557 & I-4 Westbound	F (110.4)	F (164.6)	F (164.6)	Volumes increased under Build Alternatives. Interchange will be evaluated using improvement(s) in upcoming traffic memo	F (119.8)	F (179.7)	F (179.7)	Volumes increased under Build Alternatives. Modify the westbound off ramp right turn lane by adding a receiving lane instead of merge lane. See Appendix I
	*SR 557 & I-4 Eastbound	C (15.8)	E (44.7)	E (44.7)	Volumes increased under Build Alternatives. Interchange will be evaluated using improvement(s) in upcoming traffic memo	F (70.3)	F (135.2)	F (135.2)	Volumes increased under Build Alternatives. Modify the eastbound off ramp right turn lane by adding a receiving lane instead of merge lane. See Appendix I

Synchro Version 11 Build 168. *:Roundabout

LOS notes:

Delay is in sec/veh units

:Level Of Service (LOS) E reflecting at capacity operations

:Level Of Service (LOS) F reflecting over capacity operations

14.0 I-4 Master Plan – Qualitative Measures

A.` Els provide improved travel time reliability

1. Transit - Express buses using ELs offer faster, more reliable service than buses in GULs

2. Emergency vehicles - Improved and more predictable response times in ELs vs. GUL

B. ELs provide users with travel options

1. No one is required to use/pay toll for ELs

2. Users have the option to use ELs for time-sensitive trips and can choose ELs when they believe the value of their time savings exceeds the toll cost

C. ELs address driver expectancy and consistency with adjacent I-4 BTU and TBNext EL systems

1. ELs provide more systemwide continuity for regional trips between Tampa and Orlando and ensure regional travel time reliability

D. ELs reduce fuel consumption and air pollution

1. Stop-and-go conditions in GULs produce more emissions and increase wear and tear on vehicles

2. ELs encourage carpooling (shared tolls, HOT lanes), further reducing congestion and emissions

E. Consistent vehicle speeds in ELs may reduce crashes vs. variable speeds in congested GULs

F. ELs provide revenue to support future maintenance, roadside services, enforcement

Build Alternative 2 is proposed as the recommend mainline strategy because of improvements to traffic operations, safety, regional travel time reliability, user options, systemwide continuity and environmental benefits with small ROW impacts combined
